

PART I

COMPARATIVE OCCUPATION AND INDUSTRY STATISTICS  
1930 AND 1940

A Comparison of the Census Occupation  
and Industry Classifications and  
Statistics of 1930 and 1940

## CHAPTER I

### INTRODUCTION

In consideration of the many problems arising from our present-day complex social and industrial organization, and, more particularly, in the consideration of the many perplexing problems that daily confront those who are directing the war effort of the Nation, there is a very real and pressing need for a comparable series of occupation and industry statistics—a need not only for statistics that show as nearly as may be the occupations and industries of the workers at the most recent Federal census, but, also, for statistics that indicate the nature and direction of the trends in the occupational and industrial distribution of the Nation's labor force. Unfortunately, the marked differences between the 1930 census occupation and industry classifications and the corresponding classifications adopted for use at the 1940 census preclude direct comparison of the 1930 with the 1940 statistics, except in a small proportion of the cases. And, because the detail of the tabulations of the 1940 census data usually was not the same for each sex, or for each of the employment status classes that compose the experienced labor force—the employed, the workers seeking work, and the public emergency workers—it is impossible from the published volumes to compile 1940 figures for the total workers in any occupation. Thus, first because of the changes in classification, and, second, because some of the necessary data are not available, except in the census files, it is impossible for even a trained statistician, without access to census files, to work out accurate comparisons between the 1930 and the 1940 census occupation and industry statistics. Even though these barriers did not exist, neither the busy executives of our war bureaus nor other busy persons have the time for the extensive research involved in working out a comparable series of statistics.

The purpose of this part of the report is not to discover and discuss the social and economic trends that may be shown or indicated by the statistics presented. The primary aim has rather been (1) to work out as accurately and as completely as possible comparable occupation and industry statistics for the United States for the census years 1930 and 1940, and so far as was possible, for the census years 1920 and 1910; and (2) to present these statistics in a plain, simple form, ready for use by the busy executive, by the student, or by the man in the street. A secondary aim has been to explain

briefly the methods followed in making the comparisons presented, and to describe the manner in which certain comparisons not presented in the report may be made. A further aim has been to discuss in the text the principal difficulties in working out the numerous estimates involved in making the comparisons presented, to tell how and to what extent these difficulties were met, and to discuss their probable effect on the statistics. Finally, through the use of rather voluminous footnotes and through text discussion, an effort has been made to point out the limitations of the statistics and to guide the user in properly evaluating them.

The introductory chapter of Part I of the report states the present urgent need for comparative occupation and industry statistics, the fact that such statistics are not elsewhere available for the years 1930 and 1940, the impossibility of persons without access to census files preparing such statistics, and the purpose of this part of the report. Chapter II presents the major differences between the 1930 and the 1940 census classifications, and describes the detailed study that was made of changes in the classifications. The principal factors that affect the comparability of the 1930 with the 1940 statistics are discussed in Chapter III, while Chapter IV discusses the adjustments believed to be necessary to render the 1930 and the 1940 statistics comparable. The limitations it was necessary to make in the comparisons are discussed in Chapter V. Chapter VI describes the form and purpose of the detailed occupation tables presented and discusses the degree of comparability between the 1930 and the 1940 occupation statistics for the United States, while Chapter VII describes the detailed industry tables presented and discusses the degree of comparability between the 1930 and the 1940 industry statistics for the United States.

Because of the nature of the basic data it was necessary to use in the estimates involved, some of the comparisons presented in the tables of Part I of this report, admittedly, are only approximately accurate. This unavoidable defect is keenly regretted. It is hoped, nevertheless, that Part I, with its many limitations will, in use, fully justify the attempt to adjust the principal differences between the 1930 and the 1940 occupation and industry statistics that resulted from differences in the classifications.

## CHAPTER II

### THE OCCUPATION AND INDUSTRY CLASSIFICATIONS

Users of occupation statistics, and of industry statistics, published by Federal agencies, and by State and private agencies, have long felt the need for standardization in classification. The lack of such standardization in the past has often made it impossible to compare the statistics published by the different agencies, even where comparison was not precluded by difference in coverage or difference in method of collection and compilation.

**The 1940 census occupation classification.**—In response to the growing interest in securing greater comparability between the occupation statistics published by the different government and private agencies, the American Statistical Association and the Central Statistical Board,<sup>1</sup> in 1938, appointed a Joint Committee on Occupational Classification to devise a standard classification. This Committee was composed of representatives of a number of government agencies, and representatives of the American Statistical Association and the Central Statistical Board. The Committee and its Technical Subcommittee formulated, during 1938 and 1939, a Convertibility List of Occupations.

The Convertibility List, as the name implies, is not, primarily, a classification scheme. It represents, rather, a meeting ground on which differing classification schemes can be reconciled, a basis on which the occupation statistics of the different agencies can be compared. The 1940 census occupation classification conforms in large measure to the Convertibility List. The arrangement of the census classification differs somewhat, however, from the arrangement of the Convertibility List, and a considerable number of the composite occupation groups of that List have been subdivided in the census classification.

**The 1940 census industry classification.**—To meet the long-recognized need for a standard classification for industrial statistics collected by the Federal Government and by other agencies, a Standard Industrial Classification was prepared, during 1937, 1938, and 1939, under the auspices of the Central Statistical Board, by a Committee on Industrial Classification, composed of representatives of various government agencies.

The Joint Committee on Occupational Classification recognized the need for an industrial classification to be

used in connection with the Convertibility List it was formulating. It recognized, also, that the Standard Industrial Classification, which was devised, primarily, for classifying the rather accurate and detailed data readily obtainable from the records of establishments, in some respects was not well suited for classifying the frequently less accurate and more general industrial data that can be secured in a house-to-house enumeration of the population, often made by enumerators who are not highly trained and who are less likely to interview the workers themselves than to interview persons who are not well informed about the industries of the workers. The distinctions between many of the titles of the Standard Industrial Classification require information readily obtainable from company records or officials, but not through a house-to-house enumeration of the population. After considering various aspects of the problem, the Committee concluded that a classification which would largely meet the limitations imposed by data secured in a house-to-house canvass could be obtained by combining certain titles of the Standard Industrial Classification. Work on this problem by the Committee on Occupational Classification, in cooperation with the Committee on Industrial Classification, resulted in the preparation of the Industrial Classification for Classifying Reports from Individuals.

The Industrial Classification for Classifying Reports from Individuals is a modification of the Standard Industrial Classification. The modification consists in combining the 1,411 industries of the Standard Industrial Classification into 132 industries and industrial groups, in order to form a classification suitable for classifying industrial information such as that obtainable from individual workers or members of their families through a house-to-house canvass. Since, with a few exceptions, the combinations made were of consecutive titles, the Standard Industrial Classification is readily convertible to the Industrial Classification for Classifying Reports from Individuals.

For use in classifying the industrial information collected as a part of the 1940 population census, the Bureau of the Census adopted without change the Industrial Classification for Classifying Reports from Individuals, described above.

**Major differences between the 1930 and the 1940 classifications.**—There are numerous differences between the occupation and industry classifications used at the 1930 census and the corresponding classifications

<sup>1</sup> Since July 25, 1940, Division of Statistical Standards, Bureau of the Budget, Executive Office of the President.

used at the 1940 census. The 557 occupations and occupation groups of the 1930 census occupation classification<sup>2</sup> are reduced to 451 in the 1940 census classification. In the 1930 classification, the occupations are grouped into eight large industrial divisions, as Agriculture, Manufacturing, etc., and each occupation is classified in that industrial division in which the occupation is most commonly pursued. In the 1940 classification, however, the occupations are arranged into eleven major occupation groups, such as Professional and semiprofessional workers and Clerical, sales, and kindred workers, with but minor regard to the section of the industrial field in which the respective occupations are pursued.

The 128 industries and service groups of the 1930 census industry classification are increased to 132 in the 1940 census classification; and the industries are arranged under 12 industrial divisions in the 1940 classification instead of under 8 industrial divisions as in the 1930 classification.

In addition to the differences between the 1930 and the 1940 classifications in the numbers of occupations and industries, and in their arrangement under major divisions of the classifications, there are numerous differences between the classifications in the titles and in the content of particular occupations and of particular industries. In the 1940 classifications, some new titles are introduced, while some of the 1930 titles are omitted and others of them are changed in phraseology. These changes in title usually are accompanied by changes in content. In some cases, however, there are changes in title, but no change in content, while in other cases, there are no changes in title, but there are changes in content. In some cases, the workers in a 1930 classification are distributed among different 1940 classifications. In other cases, a part of the workers in a 1930 classification are distributed among different 1940 classifications.

It is quite evident that the numerous and often drastic changes made in the classifications inevitably affected comparability between the occupation and industry statistics of 1930 and those of 1940. Because of the real need for comparable statistics, the census made a study of the degree of comparability between the 1930 and the 1940 classifications and statistics. The results of this study are presented in this part of the report.

**Study of changes made in the classifications.**—In a preliminary survey, the 1930 census classifications were compared, occupation by occupation, and industry by industry, with the 1940 census classifications to determine, first, for which occupations and for which industries the classifications apparently were the same and to determine, second, in the case of each occupation and each industry for which the classifications

apparently were different, the probable degree of comparability between the 1930 and the 1940 figures. This preliminary survey was followed by a systematic study, occupation by occupation, and industry by industry, of the changes made in revising the 1930 census classification for use at the 1940 census, and of the probable effect of these changes on the comparability of the 1930 with the 1940 figures.

Some of the occupations of the 1930 census classification are directly comparable with the corresponding occupations of the 1940 census classification. For other occupations, comparability was obtained by combining either 1930 occupations, or 1940 occupations, or both 1930 and 1940 occupations. In a considerable number of cases, however, it was impossible to so rearrange the occupations of the 1930 classification that they would be exactly comparable with the corresponding occupations of the 1940 classification. The reason for this, in the case of a particular occupation, is that there were added, in the 1940 classification, one or more occupational designations not included in the 1930 classification, or else that there were excluded from the 1940 classification one or more occupational designations included in the 1930 classification. In each such case, it was necessary to determine, so far as possible, which 1930 occupational designations were added in the 1940 classification, and which, if any, 1930 designations were excluded from the 1940 classification. Next, it was necessary to determine, so far as possible, the number of workers in 1930 represented by the 1930 occupational designations added to the 1940 classification, and the number of workers in 1930 represented by the 1930 occupational designations excluded from the 1940 classification.

Usually, it was possible, from a careful examination of the 1930 and the 1940 census occupation indexes, to determine rather closely, in the case of a particular occupation, which 1930 occupational designations were added in the 1940 classification and which 1930 occupational designations were excluded from the 1940 classification.

As with the occupation classifications, so with the industry classifications—some of the industries of the 1930 classification are directly comparable with the corresponding industries of the 1940 classification. For other industries, comparability was obtained by combining either 1930 industries, or 1940 industries, or both 1930 and 1940 industries. But, as with the occupations, in a considerable number of cases, it was impossible to so rearrange the industries of the 1930 classification that they would be exactly comparable with the corresponding industries of the 1940 classification. The reason for this, in the case of a particular 1940 industry, was that there was included a part of one or more 1930 industries, or that there was excluded a part of one or more 1930 industries. In each such case, it was necessary to determine, so far as possible,

<sup>2</sup> Condensed into 534 occupations and occupation groups in most of the published statistics.

the number of workers in 1930 represented by the part of the one or more 1930 industries added to or excluded from the 1940 classification.

Sometimes, the number of workers in 1930 represented by a particular occupational designation, or by a part of a particular industry, could be determined rather closely from available statistics. In a large number of cases, however, it was necessary to estimate these numbers. The bases found for such estimates varied from very good to very poor. Indeed, in some cases, no real bases were found for estimates and it was necessary to guess the number of 1930 workers represented by the different designations, and by the

parts of industries. In some cases, there was considerable evidence to support the guesses made, but, in other cases, supporting evidence was very meager or entirely lacking. Hence, some of the guesses made probably were very good, while, doubtless, others were wide of the mark. Fortunately, in a majority of the cases, the numbers guessed formed but a small fraction of the numbers to which they were added or from which they were deducted. Hence, it is believed that, as a rule, errors in the guesses made, in the case of a particular occupation, or a particular industry, did not affect greatly the estimated index of comparability between the 1930 and the 1940 figures.

### CHAPTER III

## THE PRINCIPAL FACTORS THAT AFFECT THE COMPARABILITY OF THE STATISTICS

#### The "Gainful Worker" Concept of 1930 and the "Labor Force" Concept of 1940

While the 1930 statistics for "gainful workers" are not exactly comparable with the 1940 statistics for the "labor force," it is believed that, occupation by occupation, and industry by industry, the highest degree of comparability can be obtained by comparing the 1930 statistics for gainful workers with the 1940 statistics for the labor force, exclusive of new workers. This is the basis of comparison adopted for this study.

The basic change from the 1930 concept of "gainful worker" to the 1940 concept of "labor force" affected the size of the labor force. Hence, this change must be taken into account whenever the gainful workers of 1930 are compared with the labor force of 1940. Briefly, the 1930 gainful worker group includes all persons who reported a gainful occupation, regardless of whether they were working or seeking work at the time of the census. The group includes all persons who *usually* worked at gainful labor, regardless of *when* they worked. The 1940 labor force, on the other hand, was determined by activity during a particular period—the last week of March 1940—and includes only persons who were working, or with a job, or seeking work in that week. Certain classes of persons, neither working nor seeking work at the time of the census, frequently were included among gainful workers in 1930, but in general, such persons are not in the 1940 labor force. On the other hand, the 1940 labor force includes new workers, few of whom were included in the 1930 gainful worker group.

In Chapter IV are presented a series of estimates designed to measure the net effect of these differences in basic concept and to represent approximately comparable totals for 1930 and 1940 distributed by age and sex. Some of the underlying reasons for the variation are considered in somewhat more detail in the following paragraphs.

#### Changes in Instructions to Census Enumerators

The number of persons returned at a Federal census as having occupations is influenced directly by the nature of the instructions in regard to the return of occupations which are given to census enumerators. If these instructions are liberal, a larger number of persons will be returned as having occupations than will be returned if the instructions are strict.

**The 1930 instructions.**—The 1930 census enumerators were instructed to return an occupation for every person who pursued an occupation from which he earned money or a money equivalent, or in which he assisted in the production of marketable goods. They were instructed, also, to return an occupation for a person who usually had an occupation but happened to be idle or unemployed at the time of the enumerator's visit. An occupation was to be returned for a part-time worker, if he spent at least the equivalent of one day per week at the occupation. And, an occupation was to be returned for an inmate of an institution, if regularly employed at productive labor or at other duties. The enumerators were instructed, however, not to return occupations for women doing housework in their own homes, without wages, and having no other employment, nor for children working at home, merely on general household work, on chores, or at odd times on other work. And they were instructed, further, not to return occupations for persons who on account of old age, permanent invalidism, or other reasons were no longer following any occupation.<sup>1</sup>

With the foregoing liberal instructions as a guide, whether or not an occupation should be returned for a person was left to the discretion of the census enumerator, except in certain specified cases.

**The 1940 instructions.**—The 1940 census instructions to enumerators in regard to the return of occupations were much more definite and strict than were the corresponding 1930 census instructions. At the 1940 census, occupations were to be returned only for experienced persons in the labor force during the week of March 24 to 30, 1940; and the experienced persons in the labor force were carefully defined. They comprised four specific classes, as follows:

1. Persons at work during the week of March 24–30, 1940, in private work or nonemergency Federal, State, or local Government work—Government work other than WPA, NYA, CCC, local work relief, etc.
2. Persons at work on, or assigned to, public emergency project work—WPA, NYA, CCC, local work relief, etc.
3. Persons who are seeking work, and are not in either of the classes above.
4. Persons who have jobs, businesses, or professional enterprises from which they were temporarily absent during the week of March 24–30, 1940.

It is evident that with these definite instructions much less was left to the discretion of the enumerator than was the case at the 1930 census.

<sup>1</sup> The industry, business, or place in which the person worked was to be returned in all cases where an occupation was reported.

Instructions in regard to specific groups.—The instructions to enumerators show that all or a large part of the persons in certain specific groups were to be included among the gainful workers in 1930, but were to be excluded from the labor force in 1940.

Unemployed seasonal workers—persons reported idle because of seasonality (off season)—were to be included among the gainful workers in 1930, but were to be excluded from the labor force in 1940, unless they were actively seeking work.

Employed inmates of institutions were definitely excluded from the labor force of 1940. The 1930 census enumerators, however, were instructed thus:

For an inmate of such institution [home, asylum, penitentiary, jail, reform school, or convict camp], if regularly employed, return the occupation pursued in the institution, whether the employment be at productive labor or at other duties, such as cooking, scrubbing, laundry work, etc. -----

An interesting example of the more liberal instructions to census enumerators in 1930 than in 1940 is furnished by the instructions in regard to ability to work. The 1940 census instruction, for persons not working, not seeking work, and not having a job, was—

Enter "U" [in col. 25] if the person was unable to work because of permanent disability, chronic illness, or old age.

The corresponding 1930 census instruction was—

Is he able to work? In deciding whether a person is able to work, it is necessary to remember that there are many kinds of jobs and that many of them require little physical or mental effort. Write "Yes" [in col. 12] if the individual is neither too young nor too old to be capable of some kind of regular employment and has no mental or physical disability which makes it impossible for him to work. It is not necessary that he be capable of heavy labor or that he be able to continue in his regular trade or occupation.

Write "No" [in col. 12] for those of advanced age, for the mentally weak, for those unable to work because of ill health, and for those temporarily or permanently disabled by accidents.

Because of these differences between the 1930 and the 1940 instructions, many persons were returned as "able to work" in 1930, and were included among the gainful workers, who would have been returned as "unable to work" in 1940 and excluded from the labor force.

In 1930 unemployed persons who reported gainful occupations and who reported, also, that they were out of a job and unable to work (Unemployment Class C<sup>2</sup>) were included among the gainful workers; but, in 1940, most of such persons were excluded from the labor force.

Persons having jobs but idle on account of sickness or disability (Unemployment Class D<sup>2</sup>) were included among the gainful workers in 1930, but some such persons, particularly if they had been unemployed for a long period, were excluded from the 1940 labor force.

Notwithstanding specific instructions to the contrary, a considerable number of permanently disabled persons and some retired persons were returned and counted as gainful workers in 1930. Such persons were not included in the labor force in 1940.

As a result of census enumerators not following their instructions carefully, a considerable number of occupational entries were omitted from the 1930 schedules and a considerable number of employment status entries were omitted from the 1940 schedules.

New workers—first job seekers—were to be excluded from the gainful workers in 1930 but were to be included in the labor force of 1940. Since the 1940 data by occupation and industry presented in this report refer to the experienced labor force, excluding new workers, this difference does not affect the comparisons by occupation and industry, but it does affect the comparison of the total number of gainful workers in 1930 with the 1940 total for persons in the labor force.

Effect of differences in questions and instructions.—In general, the result of the difference in the schedule questions, and of the more liberal instructions in 1930 than in 1940, was that the 1930 census enumerators returned occupations for persons who would not have been returned by enumerators as in the labor force in 1940. The effect of the 1930 liberal instructions probably was to incline the enumerators toward *including* as "gainful workers" all who could properly be so included, while the effect of the 1940 procedure was to *exclude* from the "labor force" persons who did not definitely belong in one of the four specified work-status categories. Thus, in the 1930 census many border-line cases were included in the gainful worker group, which, in the 1940 census, would have been excluded from the labor force; and large numbers of those excluded from the labor force in 1940 doubtless would have been enumerated as gainful workers by enumerators following the 1930 census instructions, which called for the return of occupations for all persons who were *usually* gainfully occupied. There is considerable evidence that many of those excluded from the 1940 labor force *usually* pursued gainful occupations.

The effect of the principal differences between the 1930 and the 1940 schedule questions and instructions to enumerators on the total numbers returned as workers is estimated in the following chapter of this report. No such estimates have been attempted, however, in the figures for individual occupation and industry groups, although it is quite evident that the numbers returned as working in certain occupations and, also, the numbers returned as working in certain industries, were affected appreciably by differences in the schedule questions and instructions to the census enumerators.

#### Other Factors that Affect the Statistics

The relative proportions of the population 14 years old and over reported as gainful workers in 1930 or as in the labor force in 1940 were affected also by a number of other factors, in addition to the differences in enumeration procedures. These factors, without doubt, had some effect also on the relative numbers returned in specific occupations and industries.

<sup>2</sup> Fifteenth Census (1930) Report on Unemployment, Vol. I, p. 6.

**Differences in processing methods.**—There were differences between the 1930 and the 1940 methods of processing the enumerators' returns, and these differences, though frequently intangible, may have contributed in some measure to the difference between the proportion of the population classified in the "gainful worker" group in 1930 and the proportion classified in the "labor force" in 1940.

**Decline in employment opportunities.**—The decline in employment opportunities that characterized the decade 1930-40 affected the employment of young workers particularly. Except for the lack of jobs, large numbers of youth, classified in the 1940 census as new workers, would have been at work and classified as employed workers.

Reduced employment opportunities probably affected also the number of elderly men available for employment. After a decade of depression, it had become quite difficult by 1940 for unemployed old men to secure new jobs, and it is quite probable that the proportion of unemployed old men who had become discouraged and were no longer seeking employment was larger in 1940 than in 1930. Also, because of the difference in employment opportunities, the proportion of the men in the more productive years of life who were neither at work nor seeking work at the time of the enumeration probably was greater in 1940 than in 1930.

The proportion of women in the labor force may also have been affected by adverse economic conditions during this decade. It is possible that some women who would not normally have been employed were forced to look for a job because their husbands or other breadwinners in their families were unemployed.

**Increased legal restrictions relating to youth.**—The increased legal restrictions in regard to youth pursuing certain occupations tended to decrease the proportion of them entering the labor force. Between 1930 and 1940 the minimum age for employment, at least in manufacturing, was raised to 16 in 10 States and the same standard was set by the Federal Government in the child labor provisions of the Fair Labor Standards Act of 1938.<sup>3</sup> Then, it is believed that, partly because of the decrease in employment opportunities, there was an increase in the extent to which children voluntarily continued in school after reaching the age of 14; and, in some areas, there was an increase in school attendance requirements.

**Increase in retirement of old workers.**—The increase between 1930 and 1940 in the number of workers eligible to receive pensions on their retirement doubtless resulted in an increase in the proportion of elderly men who retired voluntarily. For the same reason there was probably an increase in voluntary retirement of elderly female workers.

**Increase in proportion of females at work.**—While, according to adjusted census figures, the proportion of males 14 years old and over in the labor force in 1940 was considerably smaller than the proportion in 1930, the proportion of females 14 years old and over in the labor force in 1940 was actually somewhat larger than the proportion in 1930.

There are a number of different factors that have influenced the proportion of the population in the labor force which are not the same for males as for females. According to census figures, the proportion of males 10 years old and over gainfully occupied increased only from 74.8 percent to 76.2 percent during the 60 years from 1870 to 1930. Meantime, the proportion of females 10 years old and over gainfully occupied increased rapidly from 13.1 percent to 22.0 percent. The momentum of this movement of females into gainful occupations was strong enough in 1940 to overbalance the effect of the factors which tended to decrease the proportion of females in the labor force.

For many decades, the number of women gainfully occupied between the ages of 20 and 65 years has been increasing as reduced homemaking responsibilities have made it possible for more and more women to work outside the home. The declining birth rate, the increase in apartment dwelling, and the greater availability of household conveniences have all contributed to this result.

In the decade 1930 to 1940, as in earlier years, the process of lightening women's home duties continued, and made possible further increases in the number of married women in the labor force. Moreover, the trend in the number of women available for employment in the period 1930 to 1940 was influenced by the cumulated effects of the increases that had occurred in previous decades. Once they have entered the labor force, women tend to go on working as they grow older, so that increases in the number of women engaged in gainful occupations at a given age level, during a given decade, are reflected in later decades by increased proportions of older women remaining in the labor force. Thus, for women who were in their thirties, forties, and fifties during the decade 1930 to 1940, increased proportions of workers resulted largely from earlier increases in the employment of these same women when they were younger, during the decade 1920 to 1930 and in earlier decades.

The trend in the proportion of females at work has been affected also by the rising level of women's educational achievements, which has contributed to the expansion of the occupational field for women.

**Increase in urban residence.**—A factor which has contributed somewhat to the increase in the proportion of females in the labor force is the increase in the proportion of females 14 years old and over living in urban areas, where employment opportunities for women and

<sup>3</sup> Preliminary Statements Submitted to the White House Conference on Children in a Democracy, p. 148.

the proportion of women in the labor force are considerably greater than in rural areas.

The urbanization of the population has also exerted a considerable influence upon the proportions of children and aged men in the labor force. For these groups the movement away from rural areas has tended to reduce the number in the labor force, since employment opportunities for children and for persons over

65 years of age are considerably less favorable in the cities than in farming areas.

**Changes in age distribution of population.**—Changes in the age distribution of the population have affected the proportion in the labor force. In the case of each sex, census figures show that, as a rule, there was an increase from 1930 to 1940 in the proportion of the population in the more productive age periods.

## CHAPTER IV

### ADJUSTMENT OF 1930 GAINFUL WORKER STATISTICS AND 1940 LABOR FORCE STATISTICS TO A COMPARABLE BASIS

Comparisons between the 1940 data on occupation and industry and corresponding data from previous censuses are complicated not only by the differences in classification discussed elsewhere in the report, but also by lack of comparability between the total number of persons in the labor force as enumerated in the 1940 census, and the numbers of gainful workers shown by the censuses of 1930 and earlier years. This lack of comparability results from differences in the types of questions upon which the data were based, in the definitions given in the instructions to census enumerators, and in the processing of the enumerators' returns.<sup>1</sup>

The 1930 gainful worker statistics were obtained by means of questions regarding occupation, whereas the 1940 labor force data were obtained from questions regarding activity during a particular week. "Gainful workers" were persons reported as having a gainful occupation, that is, an occupation in which they earned money or a money equivalent, or in which they assisted in the production of marketable goods, regardless of their activity at the time of the census. The labor force, as defined in the 1940 census, includes all persons who were employed for pay or profit, or at unpaid family work, during the week of March 24 to 30, 1940, or who were seeking work or were on public emergency work during that week.<sup>1</sup>

The following are the four most important groups of persons who were enumerated differently in the 1930 and 1940 censuses:

1. *New workers.*—Inexperienced young persons seeking their first jobs, that is, "new workers," were included in the labor force in 1940. Few such persons were probably enumerated as gainful workers in 1930, since they were unlikely to report an occupation.

2. *Seasonal workers.*—Seasonal workers who were neither employed nor seeking work at the time of the census were for the most part excluded from the 1940 labor force. Such persons were enumerated as gainful workers in 1930 if they reported an occupation.

3. *Inmates of institutions.*—All inmates of penal and mental institutions and homes for the aged, infirm, and needy were definitely excluded from the labor force in 1940, regardless of their activity during the census week. In 1930, such persons were enumerated as gainful workers if they regularly followed an occupation within the institution.

4. *Retired and disabled persons.*—Persons who had retired from work and those who were permanently unable to work were for the most part excluded from the labor force in 1940. In the 1930 census, many such persons reported their former occupations and were counted as gainful workers.

In addition, the comparison of the figures from the two censuses is affected by errors and omissions in the enumerators' entries. To allow for these differences, adjustments are required for the following groups:

1. *Omitted entries.*—Persons who were actually gainful workers or in the labor force but were not classified as such because they failed to report their occupations in 1930 or their employment status in 1940.

2. *Public emergency workers.*—Persons on public emergency work in 1940 who were erroneously returned as not in the labor force.

Estimates of the adjustments in the 1930 and 1940 figures were made separately for males and females in various age groups. This procedure was followed partly because the trends during this decade in the proportions of workers were quite different for the different sex and age groups of the population. In addition, the total amount of the adjustment needed for all workers could be determined most accurately by considering separately the adjustments needed for different sex and age classes.

The figures presented here are limited to persons 14 years old and over, the age group to which the labor force statistics in the 1940 census apply. In 1930 and earlier years, statistics were obtained also for gainful workers 10 to 13 years old. In making comparisons between the 1940 labor force data and the gainful worker statistics shown in the 1930 census volumes, it is therefore necessary to deduct from the 1930 figures the 235,328 persons 10 to 13 years old who were classified as gainful workers, in addition to making the adjustments discussed in this report.

Unfortunately, it is not possible to make completely accurate adjustments of the 1930 and 1940 statistics. It is necessary to use data that are both incomplete and out of date as bases for estimates of the numbers of persons in the several classes that were enumerated differently in the two censuses. Moreover, it is impossible to measure exactly the effects of the intangible differences in the enumerator's instructions, in the types of questions used, and in the processing of the

<sup>1</sup> For a discussion in more detail, see Chapter III.

returns. It is believed, however, that the approximate adjustments given here are accurate enough to show the outstanding changes during the decade 1930 to 1940.

**Summary of adjusted figures.**—Estimates of the adjustments needed to establish comparability between the figures for 1930 and 1940, together with the resulting estimates of persons in the labor force, by age and sex, are presented in table I. The net effect of the adjustments is a reduction of 1,191,000 in the figures for gainful workers shown by the 1930 census, and an increase of 510,000 in the 1940 total for the labor force, this increase representing mainly persons for whom employment status was not reported but who were in the labor force. For each sex and age class, the effect of the adjustment is to reduce the figures for 1930 and to increase those for 1940, but the size of the adjustment differs greatly among the different age and sex classes.

The number of persons in the labor force in 1930, after the reductions called for by the adjustments made, is 47,404,000, or 53.2 percent of the population 14 years old and over. The adjusted total for persons in the labor force in 1940 is 53,299,000, or 52.7 percent of the population 14 years old and over. The slight decline in the percentage of persons in the labor force shown by these adjusted figures was the net result of a decline in the percentage for males (from 82.1 percent in 1930 to 79.7 percent in 1940), partially offset by an increase in the percentage for females (from 23.6 percent to 25.7 percent).

The decrease in the percentage of males in the labor force, shown by the adjusted figures, was characteristic of all age classes of the male population, but only among youths 14 to 19 years old and men 65 years and over was the decline very pronounced. The percentage for boys 14 to 19 years old fell from 40.1 percent in 1930 to 35.4 percent in 1940. For men 65 years old and over, the decline was even greater, from 53.9 percent to 42.2 percent. Between the ages of 20 and 64,

the proportion of men in the labor force declined only slightly during the decade.

The estimated rise in the proportion of women in the labor force was limited to the age classes 20 to 64 years; in each of the age groups in this range, the percentage increased markedly. For girls 14 to 19 years old and for women 65 and over, on the other hand, the percentages in the labor force fell.

The changes indicated by the adjusted figures for 1930 and 1940 are generally in accord with the trends in earlier decades. In table II, the adjusted percentages in the labor force in 1940 and 1930 are compared with the unadjusted percentages of gainful workers in 1900 and 1930, for each sex and age group.

The sharp decrease in the proportion of workers among persons, both male and female, in the age group 14 to 19 years represented a continuation of the long-term decline in the employment of children and young persons. This trend is closely associated with advancing educational standards and the extension of child-labor legislation. The rising percentages of women in the labor force between the ages of 20 and 64, and especially between 20 and 44 years, were in accordance with the long-term increase in participation in the labor force on the part of women, which has continued for more than half a century. Among the factors associated with this trend are the decline in the birth rate, the urbanization of the population, and a lightening of housekeeping duties caused by the trend toward smaller homes and the increased use of mechanical appliances in the home. Between 1930 and 1940 the influx of women into the labor force was more rapid than in the preceding decade. The reductions in the proportions of workers among persons 65 years old and over represented an acceleration of the long-term trend toward earlier retirement. The introduction of the social security system during the decade 1930 to 1940 doubtless accelerated this trend.

<sup>1</sup> Estimated.

**Derivation of adjustments.**—The methods used in deriving the adjustments for the principal groups of persons enumerated differently in the 1930 and 1940 censuses are briefly described below. A detailed description of the procedures followed and the data used in making these estimates is in preparation.

**New workers.**—Since no statistics are available showing the number of inexperienced workers seeking their first jobs at the time of the 1930 census, it was necessary to estimate the size of this group by means of data from the 1940 census.

The number of new workers was doubtless much smaller in April 1930, when the economic depression had but recently begun, than in March 1940, when the group of first-job seekers was swelled by an accumulation of young people who had finished school in 1939 or earlier and had not yet found a job. In April 1930, the great majority of persons seeking their first jobs were doubtless youths who had entered the labor force since October 1929; most of those who began looking for work before that time had probably succeeded in finding jobs. Between October 1929 and April 1930, on the other hand, the chances of finding work for young people entering the labor force were probably not much better than those between October 1939 and April 1940.

It is believed that the best estimate of the number of new workers not counted as gainful workers in 1930 who would have been included in the labor force if the 1940 procedures had been followed can be made by assuming that this number was the same, in proportion to the total number of workers, as the number of new workers at the time of the 1940 census who had entered the labor force during the 6 months preceding the census week. On this assumption, the adjustments for new workers shown in table I were estimated, separately for each age and sex group, by means of 1940 census data for new workers who had been unemployed

less than 6 months. The resulting adjustment for new workers was an addition of 211,000 to the 1930 gainful worker figures for the age groups 14 to 24 years. It is believed that the number of new workers 25 years of age and over in 1930 was negligible.

**Seasonal workers.**—Neither the 1930 nor the 1940 census shows the number of persons normally employed only at certain seasons who were neither working nor looking for work at the time of the census. Other sources of data must therefore be used to estimate the adjustments for seasonal workers who were counted as gainful workers in 1930, but who would have been excluded from the labor force by the 1940 census methods.

The adjustments for seasonal workers were based mainly on the Census Bureau's Monthly Report on the Labor Force, which provides monthly estimates of the labor force, by age and sex, beginning in April 1940. These figures were used to estimate the average seasonal increase in the labor force between April and the month at which the labor force reached its peak (usually July), for each age and sex group, for the years 1940 and 1941. These estimates of seasonal variation in the labor force are shown in table III. A very large part of the increase from April to July occurred in the age group 14 to 19 years, because of the large number of students employed during summer vacations.

The difference between the number of persons in the labor force in April and the number in the peak month is an understatement of the number of seasonal workers not in the labor force in April, since many seasonal workers are employed at other times of the year, such as the Christmas shopping season. On the other hand, the total number of seasonal workers not in the labor force in April is much greater than the adjustment for seasonal workers needed to establish comparability between the 1930 and 1940 census statistics, because many seasonal workers failed to report their occupa-

tions in 1930 and thus were not counted as gainful workers, and some seasonal workers were included by error in the 1940 labor force. It was therefore necessary to make estimates of the relationships between the seasonal variation in the labor force as shown by the 1940 monthly surveys, and the number of seasonal workers that should be deducted from the 1930 gainful worker totals to establish comparability with the labor force statistics for 1940. These relationships were quite different for seasonal workers in different age and sex groups. The figures are presented in table III.

<sup>1</sup> Figures based on unpublished data furnished by the Special Surveys Division of the Bureau of the Census.

<sup>2</sup> Figures for total 14 years old and over obtained by addition of estimates for the several age groups.

For the age group 14 to 19 years, only a small fraction of the seasonal variation was deducted from the 1930 figures, since probably comparatively few seasonal workers of these ages were reported as gainful workers in 1930. Most of the seasonal workers 14 to 19 years old were in school at the time of the 1930 census, and enumerators, regarding these persons as students, were unlikely to ask whether they had an occupation. The approximate number of student seasonal workers who were reported as gainful workers, but who would not have been classified as in the labor force, was determined by comparing the proportions of persons attending school who were reported as gainful workers in 1930, with the corresponding proportions in the labor force in 1940. The correction for student seasonal workers 14 to 19 years old, estimated in this manner, was only about one-seventh of the seasonal variation in the labor force shown by the 1940 and 1941 monthly surveys for this age group.

For women 20 years of age and over, the fraction of the seasonal variation that was deducted from the 1930 gainful worker figures was considerably larger than that for students, although many of the seasonal workers in this group also were not counted as gainful workers because of failure to report their occupations. Most of the female seasonal workers 20 years old and over were engaged in keeping house at the time of the census, and enumerators often failed to inquire about their occupations, regarding them as housewives. The

estimated adjustment for seasonal workers in the 1930 gainful worker figures for females 20 years old and over was, therefore, only about one-half of the seasonal variation shown by the 1940 and 1941 monthly figures for women of these ages in the labor force. For older women, the ratio of the estimated correction to the seasonal variation was smaller than for younger women, because the older women were less likely to report their occupations.

For men between the ages of 25 and 64, the corrections for seasonal workers enumerated as gainful workers in 1930 represent nine-tenths of the corresponding 1940 and 1941 seasonal variations. Men of these ages were unlikely to be omitted from the gainful worker count even if they were completely idle at the time of the census, since enumerators were very likely to inquire whether they usually followed any occupation. For men 65 years old and over, however, the estimated correction represents a somewhat smaller proportion of the seasonal variation.

For all age and sex classes combined, the adjustment for seasonal workers counted as gainful workers in 1930, but who would not have been included in the 1940 labor force, was a reduction in the 1930 gainful worker figures of 1,156,000.

**Inmates of institutions.**—The adjustment for “inmates of institutions” shown in table I represents an estimate of the number of inmates of penal and mental institutions and homes for the aged, infirm, and needy who were enumerated as gainful workers in 1930. No inmates of such institutions were included in the labor force in 1940. This adjustment is based on estimates of the total numbers of inmates and of the proportions reported as gainful workers, which estimates are presented in table IV. The probability of error in these estimates is rather large, since many of the data needed for making them were lacking, and some of the available data were unreliable.

The number of inmates of each type of institution in 1930, classified by sex, was estimated on the basis of the Census Bureau's reports on the population of the several types of institutions at various dates, and the reports of special investigations made by the Bureau of Labor Statistics of the Department of Labor. The age distribution of the inmates was estimated on the basis of the 1940 census statistics on ages of inmates of each type of institution.

The proportion of inmates reported as gainful workers for each type of institution was obtained from a count of the occupational entries on a small sample of the 1930 census schedules for 15 selected States.<sup>1</sup> The adjustments for inmates of institutions were derived by multiplying the estimated numbers of inmates by the proportions gainfully occupied, as obtained from the sample

<sup>1</sup> The States were Mass., N. Y., Ohio, Mich., Minn., Iowa, Kans., Ky., Tenn., Ala., Miss., Colo., Utah, Wash., and Calif. In the case of each State, several volumes of schedules were examined and all of the institutions enumerated in each volume were included in the count.

<sup>1</sup> Including State institutions for juvenile delinquents.<sup>2</sup> Including institutions for juvenile delinquents not operated by State governments.<sup>3</sup> Including institutions which could not be classified by type.

count. This procedure yielded a total of 196,000 gainfully occupied inmates of institutions to be deducted from the 1930 gainful worker figures for purposes of comparison with the 1940 data for the labor force.

**Retired and disabled workers.**—Although the 1930 census enumerators were instructed not to return occupations "for persons who on account of old age, permanent invalidism or other reasons" no longer followed any occupation, or who worked "only occasionally or only a short time each day," there is evidence that they did return occupations for considerable numbers of persons who had recently retired or become disabled, or for other reasons had withdrawn from the labor force. Most of these persons would have been excluded from the labor force if the 1940 census methods had been followed.

The 1930 unemployment census tabulations show some 372,000 persons reported as gainful workers who were probably retired or disabled, including those out of a job and unable to work, most of those out of a job and not looking for work, those having jobs but absent from work for more than 3 months because of sickness or disability, some of those reported as out of a job, able to work, and looking for a job, and those rejected from the unemployment tabulations because they were retired or permanently disabled (table V). Few of these persons would have been counted as in the labor force in the 1940 census. In addition, there was undoubtedly a large group of retired and disabled persons who were enumerated as gainful workers but were not reported on the unemployment schedules. This latter group was estimated to number 100,000, so that the total adjustment in the 1930 gainful worker figures for retired and disabled workers was a deduction of 472,000.

The age distribution of this adjustment (table I) was estimated on the assumption that it was propor-

tional to the age distribution of persons 25 years old and over who were unable to work at the time of the 1940 census, but who reported that they had worked during the preceding year. It is believed that such persons are the group most nearly corresponding to that represented by the adjustments, for which statistics are available by age. The number of retired and permanently disabled persons under 25 years old is negligible.

TABLE V.—ESTIMATED NUMBER OF RETIRED AND DISABLED PERSONS ENUMERATED AS GAINFUL WORKERS, BY SEX, FOR THE UNITED STATES: 1930

[Figures in thousands]

ITEM	Total	Male	Female
Total.....	472	370	102
Enumerated on unemployment schedules:			
In class A (Persons out of a job, able to work, and looking for a job).....	50	39	11
In class C (out of a job and unable to work).....	173	141	32
In class D (having a job but idle on account of sickness or disability).....	46	38	8
In class E (out of a job and not looking for work).....	80	56	24
Rejected from unemployment tabulations.....	23	15	8
Not enumerated on unemployment schedules.....	100	78	22

**Omitted entries.**—The statistics for gainful workers in the 1930 census represent a count of persons for whom an entry of occupation or industry was made on the census schedules. Thus persons who actually followed an occupation were sometimes omitted from the gainful worker group because the enumerator neglected the question on this subject, or because he could not obtain the information, or because for some other reason the occupation and industry questions were left unanswered. Likewise, the 1940 statistics for the labor force omit some persons who were actually working or seeking work during the census week, but for whom the enumerator did not obtain the answers to the questions on employment status. Adjustments for

these omissions are necessary in order to make the two sets of figures comparable.

Two types of omissions were considered in making the adjustments for omitted occupational entries in 1930: (a) Omissions due to carelessness or to the inability of the enumerator to get the information; and (b) omissions for young persons who were regarded as having no occupation because they had not worked long enough at any job to acquire a definite occupational attachment. Estimates of the adjustments for each of these types of omissions, by age and sex, are presented in table VI.

TABLE VI.—ESTIMATED NUMBER OF PERSONS ACTUALLY GAINFULLY OCCUPIED WHO WERE NOT CLASSIFIED AS GAINFULL WORKERS BECAUSE OF OMITTED OCCUPATION ENTRIES, BY AGE AND SEX, FOR THE UNITED STATES: 1930

	Male	Female	Male	Female
Total, 14 years and over.....	208	92	72	50
14 to 19 years.....	34	10	60	43
20 to 24 years.....	41	21	12	7
25 to 44 years.....	75	34		
45 to 64 years.....	48	15		
65 years and over.....	10	3		

The adjustments for omissions due to carelessness or lack of information were based on 1940 census data for persons in the labor force for whom occupation and industry were not reported. The adjustments for such omissions are only about half as large as the numbers of persons in the labor force in 1940 who did not report occupation or industry, because available evidence indicates that the proportions of omissions of various types of data from the 1940 census schedules were generally almost twice as great as the corresponding proportions of omissions from the 1930 schedules.

The number of omissions of the second type, those for young people who had not become attached to any particular occupation, was estimated on the basis of 1939 and 1940 census data for young people reported as neither working nor attending school. The number of boys 14 to 19 years old classified as not gainful workers and not attending school in 1930 was 577,791, whereas the corresponding group of boys not in the labor force and not in school in 1940 was estimated to number only 331,000. It was estimated that 60,000 of the 247,000 difference represented youths who failed to report an occupation in 1930 because they had not worked long at any one job, but who would have been included in the labor force by the 1940 census methods. The remainder of the difference is accounted for mainly by the adjustments discussed above for occupational entries omitted because of carelessness or lack of information (34,000), and by adjustments for new

workers not reported as gainful workers in 1930 (104,000). The balance represents miscellaneous differences, including population increase.

In 1940 there were 1,987,140 persons for whom employment status was not reported. About 20 percent of these were persons reported as not in the labor force but not assigned to any particular category of non-workers, and 80 percent were persons for whom enumerators did not obtain enough information to determine whether they were in the labor force. Estimates of the number who would have been classified as in the labor force if full information had been obtained, were made by classifying the latter group by sex, age, marital status, and school attendance, on the basis of tabulations of a small sample of the enumerators' returns. For each sex, age, marital status, and school attendance group it was assumed that the proportion in the labor force was the same in the group for which the enumerators did not obtain enough information to determine whether they were in the labor force, as in the group for which employment status was reported. The resulting estimates of the adjustments for omitted entries from the 1940 census figures for the labor force are shown in table VII. The adjustment for omitted entries was an addition of 529,000 to the 1940 total of persons in the labor force.

TABLE VII.—ESTIMATED NUMBER OF PERSONS ACTUALLY IN THE LABOR FORCE WHO WERE NOT CLASSIFIED AS SUCH BECAUSE OF OMITTED EMPLOYMENT STATUS ENTRIES, BY AGE AND SEX, FOR THE UNITED STATES: 1940

65 years and over.....	95	107	30	4

<sup>1</sup> Figures based on 5-percent cross-section sample count.

**Public emergency workers.**—It is estimated that 103,000 persons on public emergency work (other than the NYA Student Work Program) were returned in 1940, contrary to instructions, as not in the labor force. On the other hand, it is estimated that 122,000 youths working on NYA Student Work Projects were reported as in the labor force. Although these youths were included in the labor force as defined for the purposes of the 1940 census, they should be excluded for purposes of comparison with data for 1930 and other dates, because most of them probably would not have been in the labor force if the Student Work Program had not been in operation. Thus, the net change in the 1940 labor force figures resulting from the adjustment of the emergency worker figures is a reduction of 19,000.

## CHAPTER V

### LIMITATIONS OF COMPARISONS MADE

Unfortunately, it has been necessary in Part I of this report to limit the comparisons made between the 1930 and the 1940 census occupation and industry figures. The principal limitations are referred to below.

**Comparative figures not compiled for States.**—The comparative figures presented in Part I of this report relate to the entire United States. Comparative figures for States have not been compiled. To make a careful comparison of 1930 with 1940 occupation and industry figures for States would be a large and difficult undertaking. If no change was made in the classification, the degree of comparability between the 1930 and the 1940 figures for a particular occupation or industry apparently should be approximately the same for a State as for the United States. If the classification was changed, then the degree of comparability between the 1930 and the 1940 figures for a particular occupation or industry may be approximately the same for a State as for the United States, or it may be quite different. The degree of comparability between the 1930 and the 1940 figures frequently will not be the same for a particular State as for the United States in the case of an occupation or industry that is pursued mainly in certain localities and is pursued in the particular State by a relatively small number of workers.

A comparison of the 1930 with the 1940 occupation and industry figures for States would necessitate making for each State much the same careful study of differences between 1930 and 1940 classifications and employment as was made for the United States; and special tabulations and compilations of census occupation and industry data for States would be necessary. For these reasons, the Census Bureau has not made a study of the comparability of the 1930 with the 1940 State figures. It is impossible for one to make such a study from the data published in census occupation reports. Since these data do not include an occupational or an industrial distribution of public emergency workers for States, and since they show for States experienced workers seeking work only by intermediate occupation groups, it is impossible to compile from them statistics showing for States a detailed occupational or industrial distribution of the 1940 labor force, except new workers. And it is impossible to secure from these published data 1930 State figures showing occupations by industry, such as the 1930 United States figures from Chapter 7 of Volume V used in certain cases in compiling 1930 United States figures for comparison with 1940 figures.

**Comparative figures not compiled for cities.**—The reasons given in the preceding paragraph for not compiling comparative figures for States obtain in regard to the compilation of such statistics for cities.

**Comparative figures not compiled for major occupation groups.**—Except for the group "Domestic service workers," which includes only three occupations, comparison of the 1930 with the 1940 figures for the different major occupation groups was not attempted. Because of differences in classification, it is not possible to allocate all of the occupations of the 1930 census classification to the major groups of the 1940 classification. In some cases, in formulating the 1940 classification, the occupational designations allocated to an occupation of the 1930 classification were allocated to two or more occupations of the 1940 classification, and these 1940 occupations, in turn, were allocated to different major occupation groups. In such a case, if occupational designations representing a large proportion of the workers in the 1930 occupation were allocated to one 1940 occupation, the total of the 1930 figures for the occupation were included in making comparison with that 1940 occupation. This resulted, of course, in the 1930 figures being somewhat too large for exact comparison with the 1940 figures. In certain cases, there was such a wide distribution among 1940 occupations of the occupational designations allocated to an occupation of the 1930 classification that it would have decreased the degree of comparability between the 1930 and the 1940 figures to have allocated the 1930 figures to any one occupation for comparison with the 1940 figures. For the same reason, the total of the figures for a 1930 occupation sometimes could not be allocated to any one major occupation group. Then, in order to obtain comparability between the 1930 and the 1940 occupation figures, it was necessary, in a number of cases, to transfer a 1940 occupation from the major group of the 1940 classification in which it belongs to another major group. For these several reasons, comparison was not attempted for major occupation groups.

**Comparative figures not compiled by sex.**—The estimated index of comparability between the 1930 and the 1940 occupation figures, as given in tables 1, 2, and 3 of this report, and likewise, the estimated index of comparability between the 1930 and the 1940 industry figures, as given in tables 6 and 7, is for the total workers in the occupation or the industry. In addition to the very large amount of work that would have been involved in making comparisons by sex, it was

found that many of the figures necessary for such comparisons were not available by sex.

Evidently, the degree of comparability between the 1930 and the 1940 occupation or industry figures frequently is not the same for each sex. Hence, the estimated index of comparability given in tables 1, 2, 3, 6, and 7 for the total workers cannot be assumed to be correct for the workers of either sex. Particularly in the case of a given occupation, the change in classification from 1930 to 1940 may have affected the figures for one sex far more than those for the other sex. The changes in the classification of "Practical nurses and midwives" constitute a striking example. These changes affected mainly the figures for males.

**Figures by sex approximately comparable in certain cases.**—When, in the case of a particular occupation or a particular industry, the workers of each sex formed a considerable and substantially the same proportion of the total workers in 1930 and in 1940, the degree of comparability should be approximately the same for the workers of each sex as for the total workers.

As a rule, when the workers of one sex formed a very large and substantially the same proportion of the total workers in an occupation or in an industry, in 1930 and in 1940, the degree of comparability should be approximately the same for that sex as for the total. And, as a corollary, when the workers of one sex formed a very small and a substantially different proportion of the total workers in an occupation or in an industry in 1930 and in 1940, the degree of comparability, as a rule, should be quite different for that sex from the degree for the total. For example, with only a few exceptions, in the case of each skilled craft, the degree of comparability should be approximately the same for male workers as for the total workers, and, conversely, should be considerably different for female workers from the degree for the total workers.

**Comparative figures not compiled by color or race or by age.**—Comparisons by color or race or by age were not attempted, since many of the figures necessary for making such comparisons were not available.

## CHAPTER VI

### THE OCCUPATION STATISTICS

#### Description of Occupation Tables 1 to 5

**Table 1.**—Part I of this report contains 5 detailed occupation tables, each for the entire United States. Table 1 shows, in parallel columns, the occupations of the 1940 census classification and the corresponding occupations of the 1930 census classification. The third column of the table shows, for the 1940 occupation, the estimated index of comparability between the 1940 tabulated figures and the 1930 tabulated figures. Insofar as was practicable, the occupations are arranged in table 1 in the order of the 1940 census classification. However, in a considerable number of cases, it was necessary to change the order of the occupations of the 1940 classification. And, in order to obtain comparability with the occupations of the 1930 classification, it frequently was necessary to combine two or more occupations of the 1940 classification. In each such case, a title for the combined group was inserted.

The purpose of table 1 is to show, for each occupation and occupation group for which figures are presented in table 2, the 1940 and the 1930 occupations which are compared, together with the estimated index of comparability between the tabulated 1940 figures and the tabulated 1930 figures.

**Table 2.**—Table 2 shows, for each of the occupations and occupation groups of the 1940 census classification, as arranged and presented in table 1—

- (1) the number of persons 14 years old and over, by sex, in the labor force in 1940, except new workers;
- (2) the number of gainful workers 14 years old and over, by sex, in the corresponding occupation or occupation group of the 1930 census classification, as shown by the 1930 census published figures;
- (3) for the total workers in the occupation or occupation group, the estimated index of comparability between the 1930 and the 1940 published figures; and,
- (4) for the total workers in the occupation or occupation group, adjusted 1930 figures.

The 1940 figures for the labor force, except new workers, presented in the detailed tables of this report represent a combination of the figures for—

- (1) the present occupations of employed workers,
- (2) the usual occupations of experienced workers seeking work, and
- (3) the usual occupations of public emergency workers.

The figures for experienced workers seeking work and those for public emergency workers are the result of estimates based on a 5-percent cross-section sample count. In most of the other census publications, the 1940 figures for the labor force, except new workers, include a complete count of the present occupations of employed workers, the last occupations of experienced workers seeking work, and the assigned occupations of public emergency workers. Since the last occupations of experienced workers seeking work and the assigned occupations of public emergency workers are in many cases quite different from their usual occupations, and since a complete count for experienced workers seeking work and for public emergency workers would inevitably differ from a sample count, it is quite evident that the 1940 figures for the labor force, except new workers, as presented in the detailed tables of this report, will differ from the figures as presented in most of the other census reports. For the entire labor force, the difference is slight—only 2,135—but for some of the major occupation groups the difference is considerable, resulting mainly from the fact that the assigned occupations of public emergency workers frequently are quite different from their usual occupations. Thus, the number of public emergency workers in the group "Laborers, including farm," based on the 5-percent cross-section sample count, by usual occupation, is 357,967 smaller than the number shown by the complete count, by assigned occupation. On the other hand, the number of public emergency workers in the group "Proprietors, managers, and officials, including farm," based on the 5-percent cross-section sample count, by usual occupation, is 102,484 larger than the number shown by the complete count, by assigned occupation. This latter difference resulted mainly from the fact that, by the sample count, 95,040 persons whose usual occupation was "Farmer" were reported as being on public emergency work. The two sets of figures are summarized in table VIII, on the following page.

Comparison of the two sets of figures for experienced workers seeking work, and of the two sets for public emergency workers, indicates that the best available occupational distribution of the Nation's labor force in 1940, for comparison with the distribution in 1930, re-

## COMPARATIVE OCCUPATION STATISTICS, 1870-1940

<sup>1</sup> The figures presented are estimates based on 5-percent cross-section sample.

sults when the usual occupations of experienced workers seeking work and the usual occupations of public emergency workers are combined with the present occupations of employed workers. As stated above, these are the combinations made in compiling the 1940 occupation figures for the detailed tables of this report.

**Table 3.**—Table 3 shows for each selected occupation and occupation group included—

- (1) the number of persons 14 years old and over in the labor force in 1940, except new workers;
- (2) the number of gainful workers 14 years old and over in the corresponding occupation or occupation group in 1930, in 1920, and in 1910, as shown by the published census figures;
- (3) the estimated index of comparability between the published figures for 1930, for 1920, and for 1910 and the 1940 published figures; and
- (4) adjusted figures for 1930, for 1920, and for 1910.

There is real need for a comparable series of statistics showing the trends in the occupational distribution of the Nation's labor force over a considerable period.

Unfortunately, for a large proportion of the occupations, changes made in the census occupation classification preclude direct comparison of the 1940 census statistics with those of earlier censuses. Table 2 presents the comparisons that have been worked out between the 1940 and the 1930 statistics. For a considerable number of the occupations, the estimated index of comparability between the 1940 and the 1930 tabulated figures ranges between 0.91 and 1.10. For most of these occupations, the 1920 and the 1910 figures are either directly or approximately comparable with the 1930 figures. Hence, it was possible to compile table 3, which presents for selected occupations a fairly comparable series of statistics extending over the 4 census years, 1940, 1930, 1920, and 1910. For some of these occupations, the 1940 figures are believed to be directly comparable with the figures for each of the three preceding censuses. Our examination indicates that for none of them are the 1930 unadjusted figures presented over 10 percent too large or too small for

complete comparability with the 1940 figures. In the case of each occupation, the 1930 published figures are believed to be at least approximately comparable with those for 1920 and 1910. At each of these three censuses, however, a small number of occupational designations, as returned by the census enumerators, were assigned to an occupation different from that under which they would have been classified at one or both of the other two censuses. Wherever such changes were made, the figures for the three censuses are not exactly comparable, and, hence, a small increase or decrease from one census to another in the number of workers shown in an occupation—whether by the unadjusted figures or by the adjusted figures—may be apparent only and due to a difference in classification.

For the reasons stated on page 17, the comparisons presented in table 3 were not made by sex.

**Table 4.**—Table 3 includes each occupation for which it was believed that adjusted figures, approximately comparable with the tabulated 1940 figures, could be computed for the three census years, 1930, 1920, and 1910. It is quite evident, however, that at times the need for a comparable series of statistics extending through the four census years, 1940, 1930, 1920, and 1910, for occupations not included in table 3, may be great enough to justify comparisons that, at best, are but very roughly approximate. To facilitate the making of such comparisons, and for other uses, table 4 is presented. Table 4 shows, for the United States, the number of gainful workers 14 years old and over, by occupation and sex, in 1930, in 1920, and in 1910, with the occupations arranged according to the 1930 census classification.<sup>1</sup>

For any 1940 occupation or occupation group for which comparison with a corresponding 1930 occupation or occupation group is made in table 2 of this report, comparison may be made for the *total* workers for 1940, 1930, 1920, and 1910, if the occupation or occupations for 1930, as shown in table 1 of this report, are included in table 4 and are shown by table 4 to be comparable with the corresponding occupations there presented for 1920 and for 1910. It will be noted that for some occupations comparison may be made with the 1920 figures but not with the 1910 figures, and that, in the case of each census year, the degree of comparability may be affected by the limitations stated in the footnotes.

For any occupation for which a comparison between the 1940 and the 1930 figures is presented in table 2, the 1920 and the 1910 figures, given in table 4, may be adjusted to increase the degree of comparability by assuming, in the case of the figures for each year, that the index of comparability with figures for the preceding census year is the same as that between the 1930 and

the 1940 published figures, as given in table 2. It is certain that, at best, this assumption frequently would be only approximately correct. It doubtless is true, also, that because of minor changes in the classification and because of intangible differences in the collection and in the processing of the original data the degree of comparability, in the case of a particular occupation, may not be, and frequently will not be, as high between the 1930 and the 1920 figures, or between the 1920 and the 1910 figures, as between the 1940 and the 1930 figures.

In view of the limitations here pointed out, comparison of the figures for any occupation not included in table 3 should be made with caution and with the knowledge that when completed the adjusted figures may include a sizable element of error.

**Table 5.**—Occupation data were collected and compiled at the 1940 census for workers 14 years old and over, while at each of the censuses from 1870 to 1930 occupation data were collected and compiled for workers 10 years old and over. Hence, in making comparisons between the occupation statistics of 1940 and those of earlier censuses it is necessary to deduct from the statistics for the earlier censuses figures for child workers 10 to 13 years old. These deductions have been made in the case of most of the statistics presented in this report for the years 1930, 1920, and 1910. To facilitate making them in other cases and to show the number and the occupational distribution of child workers 10 to 13 years old in 1930, in 1920, and in 1910, table 5 is presented. Table 5 shows the number of children 10 to 13 years old engaged in gainful occupations in 1930, in 1920, and in 1910, classified by occupation and sex, with the occupations arranged according to the 1930 census classification.

As stated in census occupation reports, it is believed that the number of children returned by the census enumerators as engaged in gainful occupations, and particularly the number returned as engaged in agricultural pursuits, was far too large in 1910 and considerably too small in 1920 for direct comparison with the number returned in 1900 and the number returned in 1930.<sup>2</sup> And, largely because many child workers 10 to 13 years old do not work regularly, it is believed that in many cases the striking change from one census to another in the number of children 10 to 13 years old in an occupation, as shown by table 5, is in large measure apparent only and the result of differences in the completeness of the enumeration. In general, it is believed that the statistics presented in table 5 for children 10 to 13 years old have not nearly as high a degree of accuracy as have the statistics presented in table 4 for workers 14 years old and over.

### Degree of Comparability Between the 1930 and the 1940 Occupation Figures for the United States

This section presents a discussion of the estimated degree of comparability between the 1930 and the 1940 occupation figures for the United States, as presented in table 2. The estimated degree of comparability is indicated by an adjustment factor, in column 3 of table 2, which serves, also, as an index of comparability.

**Total figures.**—The total number of persons 14 years old and over reported as gainful workers in 1930 was 48,594,592—37,915,544 males and 10,679,048 females—while the total number reported in the labor force in 1940 was 52,789,499—39,944,240 males and 12,845,259 females. These figures represent 54.5 percent of all persons 14 years old and over in 1930 and 52.2 percent of the corresponding group in 1940. The percentages are 84.1 in 1930, as against 79.0 in 1940, for males and 24.3 in 1930, as against 25.4 in 1940, for females.

As given above, the 1930 total figures for gainful workers are not comparable with the 1940 total figures for the labor force, since the 1930 totals include large numbers of seasonal workers, employed inmates of institutions, persons unable to work, and retired persons—classes not included in the 1940 totals. Furthermore, a considerable number of occupation and industry entries were omitted from the 1930 schedules, and a considerable number of employment status entries were omitted from the 1940 schedules. No published or adjusted total figures are presented in table 2.

In chapter IV, the 1930 gainful worker figures and the 1940 labor force figures are adjusted to a comparable basis (see table I, p. 12). The adjusted 1930 figures—total, 47,404,000; males, 37,008,000; females, 10,396,000—represent 53.2 percent of all persons, 82.1 percent of the males, and 23.6 percent of the females 14 years old and over in 1930. The adjusted 1940 figures—total, 53,299,000; males, 40,284,000; females, 13,015,000—represent 52.7 percent of all persons, 79.7 percent of the males, and 25.7 percent of the females 14 years old and over in 1940. These percentages, admittedly only approximately accurate, support the general conclusion that during the decade 1930-40 there was a small decrease (0.5) in the percent of the total population, a considerable decrease (2.4) in the percent of males, and a considerable increase (2.1) in the percent of females 14 years old and over in the Nation's labor force.

**Figures for occupations.**—There is great variation from one occupation to another in the estimated degree of comparability between the 1930 and the 1940 figures. This is shown by the variations in the index of comparability given in column 3 of table 2. For those occupations for which the classification was the same in 1940 as in 1930, the index of comparability is 1.00. On the other hand, for those occupations for which the classi-

fication was quite different at the two censuses, the index of comparability is likely to deviate considerably from 1.00, particularly if the number of workers in 1930 represented by the additions to the 1940 classification was quite different from the number in 1930 represented by the exclusions from the 1940 classification. In those cases in which the additions and the exclusions involved a large proportion of the total workers in the occupation, the actual degree of comparability may be appreciably different from the estimated degree arrived at by the computations made. The reason for this is that, as a rule, the larger the proportion of the workers involved in the estimates made of the numerical importance of the designations added or excluded, the greater were the chances for material error. For a number of the occupations of the 1940 classification, there were no comparable occupations in the 1930 classification.

The 1930 figures for a particular occupation presented in column 2 of table 2 are the tabulated census figures; and the estimated index of comparability between the 1940 figures and the 1930 figures for a particular occupation, as given in column 3 of table 2, is the result of an evaluation of the numerical effect on the 1930 tabulated figures of the changes made in the 1930 census occupation classification in revising it for use at the 1940 census. In computing the probable index of comparability no account was taken of the effect on the figures of differences between 1930 and 1940 in census enumerators' returns or of differences in methods of processing these returns. Yet, there were differences in the returns and there were processing differences, and these differences did affect the figures, notwithstanding the fact that in the case of a particular occupation the effect cannot be measured.

A notable difference in the enumerators' returns was the return in 1930 of occupations for large numbers of seasonal workers, employed inmates of institutions, persons unable to work, and retired persons—persons for whom occupations usually were not returned in 1940. Processing differences resulted from the fact that the 1940 census population schedule called for the return of the highest grade of school completed and for a return of the wage or salary income received—information not called for by the 1930 population schedule. The return of the highest grade of school completed and of the income received made possible a more exact classification in 1940 than in 1930 of such indefinite returns as "engineer," "nurse," etc. Indeed, the decrease from 1930 to 1940 in the numbers in certain professions and the small increase in the numbers in others doubtless resulted in some measure from a more strict classification of the returns for professional workers in 1940, when the highest grade of school completed and the income received frequently were used as guides in deciding whether or not a worker should be classified as a professional worker. Then, the indexes used by

the clerks who coded the occupation returns were more nearly complete in 1940 than in 1930; and the published information in regard to occupations and industries and their proper classification, available to the coding clerks, was far more extensive in 1940 than in 1930. Furthermore, research to determine the proper classification of indefinite enumerators' returns was more extensive in 1940 than in 1930.

Assuming that no error was made in estimating the degree of comparability between the 1930 and the 1940 figures for a particular occupation, it is evident, nevertheless, that because of the intangible effect of the differences in the enumerators' returns and in the processing of these returns, the actual degree of comparability may be somewhat different from the estimated degree expressed by the index of comparability.

**Occupations of public emergency workers.**—As stated in a preceding paragraph (p. 19), the 1940 figures presented in table 2 represent a combination of the figures for the present occupations of employed workers, the figures for the usual occupations of experienced workers seeking work, and the figures for the usual occupations of public emergency workers. A study of the figures before they were combined indicated strongly that for some of the occupations in which large numbers of public emergency workers were employed the increase from 1930 to 1940 in the total number of workers shown by table 2 resulted in considerable measure from emergency workers who had never had other regular employment having returned their assigned emergency occupations as their usual occupations. Examples of such occupations follow:

- Artists and art teachers.
- Attendants and assistants, library.
- Dressmakers and seamstresses (not in factory).
- Operatives, apparel and accessories.
- Laborers, construction.
- Lumbermen, raftsmen, and woodchoppers.

The increase from 1930 to 1940 in the total number of workers in certain occupations other than the above doubtless resulted in part from the large number of emergency workers employed in closely related occupations. "Foremen, construction," and "Cement and concrete finishers" are examples of such occupations.

It is evident, of course, that the increases referred to in the preceding paragraph, insofar as they came from emergency project activities, were not normal increases due to regular growth in the demand for workers in the several occupations but, rather, were abnormal increases resulting from government fiat.

**Unusual occupations of females.**—In 1930, in 1920, and to a large extent in 1910, the cards representing returns of females in occupations seldom pursued by females were sorted out, checked back to the schedules, and corrected, if there was evidence on the schedule that the classification was wrong. While this procedure involved a large amount of work and expense, it

did remove the most obviously visible misclassifications. However, since, in 1930, the corrections were made after the preliminary count of the cards by industry, the published 1930 industry figures usually do not agree with the occupation figures as to the total number, or as to the sex and industrial distribution of the workers in an area.<sup>3</sup>

At the 1940 census, a count of the occupation cards, by major occupation group and by industry, was made prior to the counts by occupation. Hence, when this first count was made, there had been no opportunity to check the accuracy of the cards as to the occupations, or as to the sex, age, color or race, or marital status of the workers they represented. However, the Bureau of the Census desired to maintain complete comparability between the figures of the count by industry and major occupation group and the figures of the later occupation counts, in order to avoid having for an area, as it had in 1930, two sets of figures which did not agree as to the total number of workers or as to their sex or industrial distribution. Furthermore, at the time the detailed occupational tabulations were made in 1940, there was urgent demand for the occupation figures and other data coming from the same machine tabulations, and the funds available for the completion of these tabulations were limited. It was decided, therefore, to forego, for the most part, the process of checking the questionable cards back to the schedules and to make no attempt to check occasional returns of unusual occupations for females, except in those extreme cases where the occupation seemed to be quite impossible, as, for example, women returned as locomotive engineers. Returns of this latter class were adjusted, and all cases where the questionable item represented considerable numbers were looked up and corrected; but small numbers of border-line cases, such as women returned as blacksmiths, were allowed to remain.

The 1940 figures for females in these unusual occupations are, therefore, not comparable with those for 1930, and any nominal increase which the figures may show should be regarded as probably the result of change in card correction procedure. In particular, these nominal increases should not be interpreted as indicating an expansion of the field of female activities.<sup>4</sup>

**Occupations only apparently comparable.**—In a number of cases, the title and figures for an occupation are so nearly the same in 1940 (table 2) and in 1930 (table 4)

<sup>3</sup> Fifteenth Census Population Reports, Vol. III, tables 10 and 20, and Vols. IV and V.

<sup>4</sup> Occupations in table 2 for which the data for females should be interpreted with special caution include most of the occupations in the major group "Craftsmen, foremen, and kindred workers"; the specified occupations listed first in the major group "Operatives and kindred workers" (groups 83-103, except groups 88f, 88g, 93, 95, 99, 103d, 103e, 103f, 103h, 103i, 103m, and 103p); some of the occupations in the major group "Protective service workers"; and the specified groups (groups 143-146) of laborers in the major group "Laborers, except farm and mine." For example, many of the females listed as skilled "Machinists" or "Mechanics and repairmen (not elsewhere classified)" actually were semiskilled machine operators; and many females listed as "Painters (construction and maintenance)" were interior decorators.

that the figures may appear to be comparable, although it is indicated in column 2 of table 2 that they are not. In each such case, investigation showed that the classification was not the same at each census. The following are examples of such occupations:

TABLE IX.—OCCUPATIONS ONLY APPARENTLY COMPARABLE: 1930 AND 1940

OCCUPATION, 1940 TITLE	OCCUPATION, 1930 TITLE	1940, TOTAL	1930, TOTAL
Religious workers.....	Religious workers.....	35, 172	31, 290
Advertising agents.....	Advertising agents.....	35, 692	49, 020
Structural and ornamental metal workers.....	Structural iron workers (building).....	38, 631	28, 966
Operatives, blast furnaces, steel works, and rolling mills.....	Operatives, blast furnaces and steel rolling mills.....	117, 959	106, 652
Laborers, blast furnaces, steel works, and rolling mills.....	Laborers, blast furnaces and steel rolling mills.....	188, 280	235, 705
Laborers, agricultural machinery and tractors.....	Laborers, agricultural implement factories.....	10, 528	10, 872

**Occupations classified with difficulty.**—There were numerous occupational returns at the Sixteenth Census that were classified with difficulty. The chief difficulty came from the failure of census enumerators to return exact designations of specific occupations. This failure resulted, in some cases, from the carelessness or inefficiency of the enumerators themselves. In other cases, the failure to make definite returns resulted from the lack of knowledge of specific occupations and their technical designations on the part of the enumerators, and from the lack of knowledge of the specific occupations of the breadwinners of the family on the part of wives, children, and others from whom the enumerators, in their house-to-house canvass, usually secure their information.

In many instances, indefinite occupation returns could be assigned to the proper classification through an examination of other information on the schedule, such as family relationship, age, education, and wage or salary income. Although the use of other pertinent information on the schedule would not always result in an accurate assignment, it is believed that in the majority of cases the proper assignments were made. However, it is possible that in the case of certain occupations the number of faulty returns and the degree of inaccuracy in classifying them affected the accuracy of the resulting statistics perceptibly. The more important of these occupations are referred to in the following paragraphs of this chapter.

**Technical engineers.**—At each census a considerable number of men who are trained professional engineers and who are doing engineering work are not included in the census figures for technical engineers because they are returned on the census schedules and are classified as vice presidents, executives, managers, superintendents, builders, contractors, etc. The relatively small increase in the number of technical engineers during the decade 1930-1940, shown by the census figures, doubtless resulted largely from the fact that, as a result of the depression, an unusually large

proportion of the young men who graduated from engineering schools during the decade were not working as engineers in 1940. Many of them, and some of those who had worked as engineers in 1930, were working in occupations entirely outside of the engineering field. Unfortunately, we have no exact measure of the total number of such cases. According to a 5-percent cross-section sample count, 5,320 males on public emergency work, and 10,660 males seeking work, in 1940 gave technical engineer as their usual occupation; and 7,060 more employed males reported technical engineer as their usual occupation than as their current occupation at the time of the 1940 census.<sup>5</sup>

That the number of young men who entered and continued in the engineering profession during the decade 1930-1940 was much smaller than would have been the case had the decade been a normal one is shown by the marked change from 1930 to 1940 in the age distribution of technical engineers. The modal 10-year age period for male technical engineers was 25 to 34 years in 1930 and 35 to 44 years in 1940.

TABLE X.—MALE TECHNICAL ENGINEERS IN SPECIFIED AGE GROUPS: 1930 AND 1940

AGE GROUP	1930	1940 <sup>1</sup>	1940 <sup>1</sup>
	Technical engineers (includes surveyors)	Technical engineers and surveyors	Technical engineers
25 to 34 years.....	77, 216	70, 666	64, 872
35 to 44 years.....	62, 380	86, 212	82, 934
45 to 54 years.....	39, 265	61, 042	59, 281

<sup>1</sup> The 1940 figures do not include technical engineers on public emergency work, for whom age statistics are not available.

As a group, technical engineers were considerably older in 1940 than in 1930. Evidently, the number of young men who entered and continued in the profession was far smaller during the decade 1930-1940 than during the preceding decade.

At the 1940 census, persons under 35 years old, returned as technical engineers, were not coded as technical engineers unless they had had at least 4 years of college education. An examination of a small sample of the coded schedules showed that the operation of this rule resulted in a considerable number—possibly as many as 12,000—of the persons who were returned as technical engineers not being coded as technical engineers. The 1930 schedules did not include the information necessary for the application of such a rule.

Our analysis disclosed no reason for doubting the substantial accuracy of the census figures showing the number of persons actually working or seeking work as technical engineers in 1940.

**Farm workers.**—The following statement shows that from 1930 to 1940 there was a rather large decrease in

<sup>5</sup> Sixteenth Census, "The Labor Force (Sample Statistics)—Usual Occupation," pp. 25 and 45.

the number of farm workers, that this decrease extended to each specified class of farm workers, and that it was particularly large in the case of one class—"Farm laborers, unpaid family workers."

TABLE XI.—FARM WORKERS IN THE UNITED STATES: 1930 AND 1940

OCCUPATION	1930	1940	Percent of decrease, 1930-40
Total farm workers.....	110,161,212	8,833,324	13.1
Farmers (owners and tenants).....	6,012,012	5,265,271	12.4
Farm managers and foremen.....	270,583	62,778	11.1
Farm laborers.....	4,078,617	3,505,275	14.1
Farm laborers, wage workers.....	3,606,004	2,312,035	11.3
Farm laborers, unpaid family workers.....	1,472,613	1,193,240	19.0

<sup>1</sup> Figures adjusted to compensate for classification changes made in 1940.

<sup>2</sup> Adjusted figures—5 percent of published figures was added.

<sup>3</sup> Adjusted figures—4 percent of published figures was deducted.

To what extent is the decrease from 1930 to 1940 in the number of farm workers, shown by the above statement, a continuation of the decrease in the total number of agricultural workers that has persisted over a considerable period of years, and to what extent may it be the result of special factors prevailing at the time of the census enumeration in 1940? And why was the decrease in the number of "Farm laborers, unpaid family workers" so much larger than the decrease in any other of the specified classes of farm workers? To what extent do the decreases indicated by the figures presented represent actual decreases in the numbers of farm workers, and to what extent may they represent apparent decreases only?

Doubtless some of the factors that contributed to the decrease in the number of farm workers throughout the period 1910 to 1930<sup>4</sup> account in considerable measure for the decreases from 1930 to 1940. To the extent that the decreases from 1930 to 1940 resulted from these continuing factors they probably largely represent actual decreases. But it is believed that some of the decreases shown by the above statement are, in part, apparent only and the result of changes in the printed instructions to census enumerators.

At the 1930 census, the enumerators were instructed to return an occupation for a person who *usually* had an occupation, even though he was idle or unemployed at the time of the enumerator's visit; and they were instructed to return an occupation for a person who worked the equivalent of only 1 day per week.

The instructions for filling the 1930 unemployment schedule included this paragraph:

Persons will be found who have been long unemployed because of change in industry, the introduction of machines, or the decline of production in certain lines. If able and willing to do work of any kind, these persons should be returned as usually working at a gainful occupation, without regard to the length of the period of idleness, provided they still expect to find employment and resume work.

<sup>4</sup> The rapid introduction of labor-saving machinery on the farm; the decrease in foreign markets for our agricultural products; etc.

The effect of the very liberal 1930 instructions doubtless was—and doubtless was intended to be—to incline the enumerators toward returning occupations not only for all persons at work but, also, for all persons who had at any time worked, if they expected to resume work at some future time.

The effect of the 1940 instructions was—and was intended to be—to incline the enumerators toward returning occupations only for very closely restricted and specifically defined persons. Whether or not a person was to be included in the labor force depended upon his work status during the week of March 24-30, 1940. To be included in the labor force, a person must, during the week of March 24-30, 1940, have been at work, or assigned to public emergency work, or have been seeking work, or have had a job, business, or professional enterprise from which he was temporarily absent.

While we have no definite measure of the effect of the difference in the instructions to enumerators, it is estimated (see pp. 11-16) that the more liberal instructions in 1930 than in 1940 resulted in the 1930 census enumerators returning occupations for many persons for whom occupations would not have been returned by enumerators following the 1940 instructions. The effect of the difference in instructions on the number of persons returned with occupations probably was particularly great in the case of seasonal and largely seasonal industries. Following the 1930 census instructions, all workers in seasonal industries were to be returned as gainful workers, even though not at work or seeking work at the time of the enumeration; but, following the 1940 census instructions, seasonal workers apparently were not to be returned as in the labor force, unless they were employed or were actively seeking work during the week of March 24-30, 1940.

In most sections of the United States, agriculture is to a considerable extent a seasonal industry, particularly as to much of the work done by field laborers. In most sections, field work does not start in nearly full volume until after March, and in few sections does field work closely approach its maximum volume before May. Hence, the 1940 instructions to enumerators, which restricted the labor force to persons at work, or assigned to public emergency work, or seeking work, or with a job, business, or professional enterprise, during the week of March 24-30, very likely resulted in the omission from the labor force of large numbers of persons who usually worked as field hands, but who were not at work or seeking work during the week of March 24-30.

The 1940 instructions to enumerators include the following statement in regard to the return of farmers' occupations:

Enter [in Col. 21] "Yes" [at work] for a farmer who usually operates a farm, even though because of bad weather conditions, temporary illness, etc., he did not actually work on the farm during the week.

According to the above instruction, the occupation of a farmer who usually operated a farm was to be returned, even though he did not actually work on the farm during the week of March 24-30. Thus, insofar as they relate to farmers, the 1940 instructions are quite similar to the 1930 instructions. At each census, the farmer's occupation was to be returned if he *usually* operated a farm. Therefore, the difference between the 1930 and the 1940 instructions to enumerators probably did not affect greatly the number of persons returned as farmers, and the decrease from 1930 to 1940 in the number of farmers, shown by the statement above, may be largely a real decrease.

That the 1940 Population Census figures for farmers and farm managers probably are fairly accurate is suggested by their close correspondence with the figures for farm operators, shown by the Census of Agriculture. The total 6,096,799 farm operators, shown by the Census of Agriculture, includes 943,581 farm operators who worked off their farms for pay 100 days or more during 1939.<sup>7</sup> It is believed that these 943,581 operators may be presumed to represent approximately the number of farm operators for whom occupations other than farmer were returned on the 1940 Population Census schedules. If these 943,581 farm operators be deducted from the total 6,096,799 farm operators, the remainder—5,153,218—is only 9,604 larger than the 5,143,614 employed farmers and farm managers shown by the Population Census, and is only 149,556 smaller than the total number of farmers and farm managers shown by the population census (table 2). Examination of the figures for the several States shows that, with the deduction of farm operators who worked off their farms 100 days or more from the total farm operators, there is, as a rule, a rather close correspondence between the number of farm operators, as shown by the Census of Agriculture, and the number of employed farmers and farm managers, as shown by the Population Census. As a general rule, the correspondence is particularly close in those States which are predominantly agricultural and not so close in those States which are largely nonagricultural. However, the several exceptions to this general rule suggest that deducting from the total farm operators those operators who worked 100 days or more off their farms during 1939—on the assumption that their principal occupation was not that of farmer—may not be equally applicable to all States.

The decrease from 1930 to 1940 in the number of hired farm workers—in "Farm managers and foremen" (11.1 percent) and in "Farm laborers, wage workers" (11.3 percent)—may have resulted in part from the instructions to census enumerators having been far more strict in 1940 than in 1930; and it may be that the occupations of those who were unemployed at the time of the census were omitted from the census more com-

monly in 1940 than in 1930. In large measure, however, the decreases in the numbers of hired farm workers, shown by the statistics presented, may be actual decreases. These decreases do not differ greatly from the decrease of 12.4 percent in the number of farmers.

The much larger decrease from 1930 to 1940 in the number of "Farm laborers, unpaid family workers" (19 percent) than in the number of "Farm laborers, wage workers" (11.3 percent) is believed to have resulted largely from the particular instruction given the 1940 enumerators in regard to the return of the occupations of the members of the farmer's family. This was as follows:

Enter [in Col. 21] "Yes" [at work] for the wife of the farmer, or other members of the farmer's family, *only if they actually worked during the week*<sup>8</sup> on tasks contributing to the income of the farm and other than home housework, occasional work, or incidental chores. Enter "No" [not at work] for a farmer's wife, or other members of the farmer's family, if they were engaged only on occasional tasks, home housework, or incidental chores.

In those sections where field work was not well under way in the last week of March 1940—and this included most sections—the enumerators, if they followed the above instruction, doubtless returned as not at work large numbers of family members who were at work later in the season. Particularly, did they probably return as not at work large numbers who were at work when agricultural employment reached its maximum in midsummer, 1940. There was nothing in the enumerator's instructions that would lead him to return these members of the farmer's family as seeking work, and they were not among the 5 classes, there enumerated, to be returned as having jobs. Although not definitely instructed on this point, many enumerators returned these persons as having jobs; but many other enumerators returned them as not having jobs, and, hence, as not being in the labor force.

The enumerator was given this further instruction:

Enter "No" [did not have a job] in Col. 24 for persons . . . not working during the week of March 24-30, who work or seek work only in limited seasons of the year, such as a professional football player who does no other work, and the housewife who may work as a saleswoman for pay only during the Christmas season.

The entries on the schedules show that many of the enumerators, following the above instruction, returned as not having jobs those members of farmers' families who were not working during the week of March 24-30, 1940, and who usually work regularly at outdoor farm work only during the seasons of the year when extra help is needed in the fields—cotton choppers, cotton pickers, fruit pickers, hop pickers, beet pullers, etc. Such persons would have been returned as gainful workers by enumerators following the 1930 instructions.

Statistics showing public emergency workers in 1940, by occupation, are not available for States. However, employed workers (except on public emergency work), together with experienced workers seeking work, included 96.1 percent of the total farm laborers in 1940. Statistics for these two classes combined, together with

<sup>7</sup> Sixteenth Census, General Report on Agriculture, Vol. III, Chap. V, pp. 328 and 343.

<sup>8</sup> Italics were inserted here for emphasis.

the statistics for gainful workers in 1930, presented in the following statement, show the number of "Farm laborers, wage workers," and the number of "Farm laborers, unpaid family workers," in 1930 and in 1940, with percent of increase or decrease, by sex, for divisions and States.

TABLE XII.—FARM LABORERS, BY SEX, FOR DIVISIONS AND STATES: 1930 AND 1940

[The 1930 figures in this table are for gainful workers; the 1940 figures include a complete count of employed workers (except on public emergency work) and of experienced workers seeking work. Percent not shown where base is less than 100]

As a rule, the number of "Farm laborers, unpaid family workers" increased from 1930 to 1940 in those States in which dairying, poultry raising, and livestock raising were prominent activities and decreased in those States in which most of the work of such laborers was in the fields. Doubtless, much larger numbers of the members of farmers' families actually were at work during the census week—March 24-30, 1940—in States in which there was much work to be done in dairying, and in poultry raising, and in caring for livestock, than in most other States; and, doubtless, the enumerators were encouraged to return such persons as at work by the following instruction, which was printed at the bottom of the Population schedule:

Include [in Col. 21, as at work during the week of March 24-30, 1940] unpaid family workers—that is, related members of the family working without money wages or salary on work (other than housework or incidental chores) which contributed to the family income.

The large increase from 1930 to 1940 in the number of "Farm laborers, unpaid family workers" in California probably is explained in part by the fact that work in the gardens, orchards, and fields was much further advanced there at the time of the census than it was in most other States.

In the case of each sex and each occupation, the very wide range from one State to another in the percent of increase or decrease in number of workers, from 1930 to 1940, suggests that the differences in increases and decreases, from one State to another, probably did not result entirely from changes in the instructions to census enumerators. For example, the changes made in the instructions probably did not account entirely for the percent of increase, from 1930 to 1940, in the number of female "Farm laborers, unpaid family workers," being 61.0 in Ohio, 103.9 in Indiana, 32.6 in Illinois, 65.6 in Michigan, and 288.7 in Wisconsin. In a particular State, the change from 1930 to 1940 may have resulted in part from changes in the instructions to enumerators,

in part from differences in the interpretation of these instructions, and in part from other causes, such, for example, as industrial changes with accompanying changes in the industrial distribution of the labor force.

In general, throughout the occupational field, persons under 20 years old formed a considerably smaller proportion of the labor force in 1940 than of the gainful workers in 1930, and the much larger percentage decrease from 1930 to 1940 in "Farm laborers, unpaid family workers" than in "Farm laborers, wage workers" is accounted for in part by the fact that, in 1930, workers under 20 years old formed a far larger proportion of the "Farm laborers, unpaid family workers" than of the "Farm laborers, wage workers"—57.4 percent, as against 17.4 percent. The decrease from 1930 to 1940 in the proportion that persons under 20 years old formed of the total workers (except emergency workers) was much larger for "Farm laborers, unpaid family workers" than for "Farm laborers, wage workers"—from 57.4 percent to 47.7 percent for the former and from 17.4 percent to 14.9 percent for the latter. The decrease of 279,977 in the number of workers 14 to 19 years old among "Farm laborers, unpaid family workers" was 96.8 percent of the total decrease.

Since young persons formed a much larger proportion of all "Farm laborers, unpaid family workers" than of all "Farm laborers, wage workers," the increased school attendance requirements between 1930 and 1940 doubtless affected the number returned in 1940 as "Farm laborers, unpaid family workers" more than the number returned as "Farm laborers, wage workers."

*Retail and wholesale merchants.*—It is sometimes difficult to determine whether a given merchant should be considered a retail merchant or a wholesale merchant, since he sells both at retail and at wholesale. Partly because of this fact, perhaps, census enumerators did not always distinguish carefully—as they were instructed to do—between retail and wholesale merchants,

and considerable difficulty was experienced in classifying the occupations for these two groups.

*Newsboys.*—A comparison of the age distribution of newsboys in 1940 with the distribution in 1930 suggests that the great increase from 1930 to 1940 in the number of newsboys 14 years old and over may have come in part from the displacement of newsboys 10 to 13 years old by older newsboys. There was a marked increase during the decade in the proportion boys 16 to 19 years old formed of all newsboys 14 years old and over. In part, the increase in the total number of newsboys may have resulted from an undervaluation of classification changes.

*Clerks in stores and salesmen and saleswomen.*—Although instructed specifically to make this distinction, many Sixteenth Census enumerators failed, as did the enumerators at preceding censuses, to distinguish between office clerks and sales persons employed in stores. The tendency was to return salesmen and saleswomen as clerks. As a result, the statistics showing the number in each of these two occupations probably are inaccurate. The group "Clerks in stores" was more strictly confined in 1940 and in 1930 than in 1920 or in 1910 to persons specifically returned as "clerks" in stores. It is believed that a majority, if not most of those included in this group in 1940 and in 1930 were sales persons.

*Workers in the building trades.*—The decrease from 1930 to 1940 in the number of workers in certain of the building trades doubtless resulted in large measure from the marked decline during the decade in the construction industry—a decline, for establishments reporting business of \$25,000 or more, in 1939 as compared with 1929, of 27.4 percent in the dollar value of work performed during the year, and a decline of 35.3 percent in the amount of the annual pay roll.<sup>9</sup> In part, the decrease in the number of workers may be accounted for by the fact that to a considerable extent the construction industry is seasonal and, in many sections of the country, was near its lowest ebb at the time of the census in 1940. Of the persons who usually worked in the construction industry, many were not at work at their regular trades during the census week, March 24–30. Some of these doubtless were working at other jobs, and some doubtless were unemployed and not seeking work and were not included in the labor force.

*Cabinetmakers and tailors.*—In those cases in which hand trades, through the introduction of machinery, the multiplication of processes, and the division of labor, have developed into factory industries, there was a tendency for the operatives to give the old trade names as their occupations, rather than the names of the specific processes they were performing. Outstanding examples of such industries at the Sixteenth Census were furniture factories and men's clothing factories.

As a result, the numbers of cabinetmakers and tailors returned probably were excessive.

*Locomotive engineers and firemen.*—In 1940, as in 1930, in 1920, and in 1910, the enumerators did not always distinguish carefully between locomotive engineers and the stationary engineers employed by steam railroads, or between locomotive firemen and other firemen employed by steam railroads. At each census, therefore, some stationary engineers probably were classified as locomotive engineers, and some firemen of stationary boilers were classified as locomotive firemen.

*Machinists.*—Machine-shop workers who are not all-round machinists appear, nevertheless, to have a tendency to call themselves machinists. Hence, it is quite probable that, at each census, many who were returned and classified as machinists were, in fact, only machine tenders.

*Painters.*—Frequently, it was difficult to determine definitely whether the return "decorator" should be allocated to "Decorators and window dressers" or to "Painters, construction and maintenance." And it was difficult to determine definitely whether the return "painter" should be allocated to "Painters, construction and maintenance" or to "Painters, except construction and maintenance"; that is, whether the allocation should be to painters, building, shipyard, railroad, etc., or to painters of factory products and those working in shops.

*Operatives and laborers.*—Where, in revising the census industrial classification, a part of a composite 1930 industry group was included in forming a 1940 industry, it frequently was difficult, from the available information, to estimate what proportion of the added 1930 workers were operatives and what proportion were laborers. Hence, in the case of each such industry, the 1930 figures for operatives and laborers combined may be more nearly accurate than are the figures for either operatives or laborers. Some outstanding examples of such 1940 industries are:

"Glass and glass products," which includes *mirrors*, classified elsewhere in 1930;

"Electrical machinery and equipment," which includes *phonographs* and *records*, classified elsewhere in 1930;

"Dairy products," which includes *ice cream* and *malted milk*, classified elsewhere in 1930;

"Sawmills and planing mills," and "Miscellaneous wooden goods," which combined group includes *caskets*, classified elsewhere in 1930; and

"Furniture and store fixtures," which includes *mattresses* and *bed springs*, classified elsewhere in 1930.

*Apprentices.*—In 1940, as in 1930, the census enumerators frequently returned children working at building and hand trades as blacksmiths, carpenters, machinists, etc., rather than as blacksmiths' apprentices, carpenters' apprentices, machinists' apprentices, etc. At each census the coding clerks were instructed that a child returned as pursuing a trade, the mental or physical requirements for the pursuit of which usually are

<sup>9</sup> Census of Business, 1939 Vol. IV, p. 24. See, also, discussion of "Construction," p. 33 of this report.

not possessed by a person of such age, should be coded as an *apprentice* and not as a *journeyman* in the designated trade. The figures for apprentices, therefore, include many who were not specifically returned as apprentices. It is probable, also, that some of those returned as *journeymen* and coded as *apprentices* were, in fact, neither journeymen nor apprentices, but only helpers or operatives.

Notwithstanding the fact that both in 1930 and in 1940 the coding clerks were instructed to code as apprentices all children returned as pursuing skilled trades, at each census considerable numbers of children under 18 years old were tabulated in the machine count of the cards as engaged in skilled trades. Because of differences between the 1930 and the 1940 method of adjusting the machine tabulation sheets, the 1930 figures for apprentices are only approximately comparable with the 1940 figures. At each census, the figures for apprentices doubtless contain a considerable element of error.

*Dressmakers and seamstresses.*—When the enumerators did not return the industry or place of work, it was difficult to distinguish dressmakers and seamstresses in factories from those working elsewhere.

*Fruit and vegetable graders and packers, except in cannery.*—It is believed that the marked increase from 1930 to 1940 in the number of fruit graders and packers may be accounted for in considerable measure by the fact that the 1930 index used by the occupation coding clerks did not show clearly that the 1930 group "Fruit graders and packers" included vegetable graders and packers. At each census, proper classification of indefinite returns was difficult where canneries were operated close to where there was fruit and vegetable grading and packing in the fields and orchards.

*Housekeepers and servants, private family.*—Notwithstanding the fact that in 1940, in 1930, in 1920, and in 1910 the census enumerators were given specific instructions to return as *housekeepers* only those women who were keeping house for wages, at each census the enumerators returned as *housekeepers* so many servants who were in no sense housekeepers, that it is believed that the statistics for "Housekeepers, private family" are very inaccurate. The statistics show more than one housekeeper to each five servants in private families in 1940, and an increase from 1930 to 1940 of 102.3 percent in housekeepers, as against an increase of only 15.4 percent in servants in private families. It seems evident that the 1930 and the 1940 figures for "Housekeepers, private family" are not comparable.

An examination made of representative returns in the family relationship, age, employment status, and income columns of the 1940 enumerators' schedules indicated strongly that many of those returned in the occupation column as housekeepers were in fact only servants, and that considerable numbers of them were housekeepers in their own homes.

*Laundresses.*—Because of incomplete returns, it frequently was difficult for the 1940 census coding clerks to distinguish between "Laundresses, private family" and other laundresses.

*Boarding house and lodginghouse keepers.*—The decrease of 21.9 percent from 1930 to 1940 in the number of boarding house and lodginghouse keepers may have resulted in large measure from the instructions in regard to returning occupations for these persons having been more specific in 1940 than in 1930. The 1940 instruction was—

Enter "Yes" [at work for pay or profit] for a person, generally the housewife, keeping five or more boarders or lodgers.

The corresponding 1930 instruction was—

Keeping boarders or lodgers should be returned as an occupation if the person engaged in it relies upon it as his (or her) principal means of support or principal source of income. If, however, a family keeps a few boarders or roomers merely as a means of supplementing the earnings or income obtained from other occupations or from other sources, no one in the family should be returned as a boarding or lodging house keeper.

An examination of representative 1930 census enumerators' schedules for 12 large cities showed that of 395 boarding and lodging house keepers who were enumerated on these schedules and who reported the number of boarders and lodgers, 106, or 26.8 percent, reported fewer than 5 each. Such persons usually were not included in the 1940 labor force. If the adjusted 1930 number of boarding and lodging house keepers, as given in table 2—142,927—be reduced 26.8 percent, it becomes 104,623. If this is approximately the number of boarding and lodging house keepers in 1930 who had 5 or more boarders or lodgers each, then this is the number that is really comparable with the number in 1940—111,609—and there was an increase of 6.7 percent rather than a decrease of 21.9 percent in the number during the decade.

*Practical nurses and midwives.*—The decrease from 1930 to 1940 shown by the adjusted figures for practical nurses and midwives may have resulted in part from an underestimate of the effect on the 1930 figures of the transfer of ward maids from this group. In some measure, the decrease doubtless resulted from the fact that, through recourse to the wage income and education information, entered on the 1940 but not on the 1930 schedules, the return "nurse" was coded "trained nurse" more frequently in 1940 than in 1930.

*Fishermen and oystermen.*—An examination made of selected 1940 census enumerators' schedules indicated that the decrease in the number of fishermen and oystermen from 73,234 in 1930 to 62,574 in 1940, shown by tables 2 and 3, may have resulted largely, or even entirely, from the fact that, since fishing is seasonal, many fishermen were not actually fishing during the census week, March 24-30, 1940, and were not included in the labor force. The returns examined indicate that there may have been no decrease in the number of fishermen and oystermen during the decade 1930 to 1940.

## CHAPTER VII

### THE INDUSTRY STATISTICS

First at the 1910 census and next at the 1930 census, the report on occupation statistics includes a table<sup>1</sup> showing occupations classified by industry. However, in neither table are all of the workers in an industry classified thereunder. In the 1910 table, for example, most professional persons are classified in "Professional service," and all telegraph and telephone operators are classified in the "Telegraph and telephone" industry, regardless of the fact that many of the professional persons and many of the telegraph and telephone operators were employed in other industries. Similar examples in the 1930 table are the classification of all telegraph and telephone operators in the "Telegraph and telephone" industry, of all bakers in "Bakeries," of all editors and reporters in "Professional service," and of all musicians in "Recreation and amusement." At the 1940 census, all of the workers in each industry were classified thereunder.

Because of the differences in classification, it is evident that direct comparison between the 1910, the 1930, and the 1940 industry figures published in the occupation reports is not possible. The purpose of this chapter is to adjust the 1930 figures, as far as is possible, so that they will be comparable with the 1940 figures. A similar adjustment of the 1910 industry figures has not been attempted.

#### Description of Industry Tables 6 and 7

**Table 6.**—Table 6 shows, in parallel columns, the industries of the 1940 census classification and the corresponding industries of the 1930 census classification. The third column of the table shows, for the 1940 industry, the estimated index of comparability between the 1940 tabulated figures and the 1930 tabulated figures. Insofar as was practicable, the industries are arranged in table 6 in the order of the 1940 census classification. In a number of cases, however, it was necessary to change the order of the industries of the 1940 classification. And, in order to obtain comparability with the industries of the 1930 classification, it frequently was necessary to combine two or more industries of the 1940 classification. In each such case, a title for the combined group was inserted.

The purpose of table 6 is to show, for each industry and industrial group for which figures are presented in table 7, the 1940 and the 1930 industries which are compared, together with the estimated index of comparability between the tabulated 1940 figures and the tabulated 1930 figures.

**Table 7.**—Table 7 shows, for each of the industries

and industrial groups of the 1940 census classification, as arranged and presented in table 6,

- (1) the number of persons 14 years old and over, by sex, in the labor force in 1940, except new workers;
- (2) wherever available, the number of gainful workers 14 years old and over, by sex, in the corresponding industry or industrial group of the 1930 census classification, as shown by the 1930 census published figures;
- (3) for the total workers in the industry or industrial group, the estimated index of comparability between the 1930 and the 1940 published figures; and,
- (4) for the total workers in the industry or industrial group, adjusted 1930 figures.

The 1940 figures for the labor force, except new workers, presented in table 7, represent a combination of the figures for

- (1) the present industries of employed workers,
- (2) the usual industries of experienced workers seeking work, and
- (3) the usual industries of public emergency workers.

The figures for experienced workers seeking work and those for public emergency workers are the result of estimates based on a 5-percent cross-section sample count. Since the 1940 industry figures given in most of the other census publications, include only a complete count of the present industries of employed workers and the last industries of experienced workers seeking work, it is quite evident that the figures for the labor force, except new workers, as presented in table 7, will differ from the industry figures as presented in most of the other census reports. (For further discussion see p. 19.)

#### Degree of Comparability Between the 1930 and the 1940 Figures for the United States

The estimated degree of comparability between the 1930 and the 1940 industry figures for the United States are discussed in this section. The estimated degree of comparability is indicated by an adjustment factor, in column 3 of table 7, which serves, also, as an index of comparability.

**Total figures.**—The 1930 total figures for gainful workers (48,594,592) are not comparable with the 1940 total figures for the labor force (52,789,499), since the 1930 figures include large numbers of workers in classes not included in the 1940 figures—seasonal workers, employed inmates of institutions, persons unable to work, and retired persons. Furthermore, through omission of entries from the enumerators' schedules, considerable numbers were omitted from the count of gainful workers in 1930 and from the labor force count in 1940. No published or adjusted total figures are presented in table 7.

In Chapter IV, the 1930 gainful worker figures and

<sup>1</sup> Thirteenth Census Report on Occupation Statistics, table VI; and Fifteenth Census Population Reports, Vol. V, Chap. 7, table 2.

the 1940 labor force figures are adjusted to a comparable basis (see table I, p. 12). These adjusted figures represent 53.2 percent of the population 14 years old and over in 1930, as compared with the 52.7 percent in 1940. According to these percentages, there was a slight decrease (0.5) during the decade in the percent of the population 14 years old and over in the labor force of the United States (table II).

**Figures for industries.**—That the variation from one industry to another in the estimated degree of comparability between the 1940 and the 1930 figures is rather large is shown by the variations in the index of comparability given in column 3 of table 7. Where there was no change in the classification, the index of comparability is 1.00; but where the classification was quite different at the two censuses, the index of comparability may deviate considerably from 1.00, particularly if the number of workers in 1930 represented by the additions to the 1940 classification was quite different from the number in 1930 represented by the exclusions from the 1940 classification. Wherever the additions and the exclusions involved a large proportion of the total workers in the industry, the actual degree of comparability may be appreciably different from the estimated degree, by reason of the fact that, as a rule, the larger the proportion of the workers involved in the estimates the greater were the chances for material error. For a number of the industries of the 1940 classification, there are no comparable industries in the 1930 classification.

In computing the probable index of comparability between the 1940 and the 1930 figures for an industry, no account was taken of the effect on the figures of differences between 1930 and 1940 in census enumerators' returns or of differences in methods of processing these returns. Yet there were differences in the returns and there were processing differences, and these differences did affect the figures, notwithstanding the fact that in the case of a particular industry the effect cannot be measured.

A marked difference between 1930 and 1940 in the enumerators' returns was the return in 1930 of occupations and industries for large numbers of seasonal workers, employed inmates of institutions, persons

unable to work, and retired persons—classes for whom occupations and industries usually were not returned in 1940. It was impossible, of course, to estimate the numbers in these four classes who worked in each particular industry in 1930.

Several factors contributed to processing differences. The indexes used by the clerks who coded the industry returns were more nearly complete in 1940 than in 1930; and published information in regard to industries, available to the coding clerks, was far more extensive in 1940 than in 1930. Then, research to determine the proper classification of indefinite industry returns was much greater in 1940 than in 1930.

It is evident that because of the intangible effect of the differences in the enumerators' returns and in the processing of these returns, the actual degree of comparability between the 1930 and the 1940 figures for a particular industry may be somewhat different from the estimated degree expressed by the index of comparability.

**Numbers of emergency workers affected figures for certain industries appreciably.**—Except in the service industries, the distribution of emergency workers by usual industry, in 1940, possibly, as a rule, corresponded roughly with the industrial distribution of employed workers. But, whether because many emergency workers had never worked regularly in any other industries, or for other reasons, so many of them apparently reported the industries in which they were working, or to which they were assigned, as their usual industries that, even in the nonservice industries, the industrial distribution of emergency workers by usual occupation, as shown by census returns, was quite different from the industrial distribution of employed workers.

Unpublished figures, based on a 5-percent cross-section sample, show that a considerable proportion of the total emergency workers are included in a few of the industries shown in table 7. In certain industries emergency workers form such a large proportion of the total workers that their inclusion affects the figures perceptibly. In the figures for each of the following industries of table 7, emergency workers form over 9.5 percent of the total workers.

TABLE XIII.—EMERGENCY WORKERS, BY USUAL INDUSTRY, COMPARED WITH TOTAL WORKERS, BY SEX, FOR SPECIFIED INDUSTRIES: 1940

[Figures for emergency workers based on a 5-percent cross-section sample]

INDUSTRY	TOTAL WORKERS			EMERGENCY WORKERS			PERCENT EMERGENCY WORKERS ARE OF TOTAL WORKERS		
	Total	Male	Female	Total	Male	Female	Total	Male	Female
Total.....	6,985,206	5,537,436	1,447,770	1,506,380	1,249,600	256,780	21.6	22.6	17.7
Forestry, except logging.....	68,777	67,402	1,375	19,280	18,940	340	28.0	28.1	24.7
Stone quarrying.....	59,781	59,123	658	12,420	12,320	100	20.8	20.8	15.2
Construction.....	3,508,434	3,462,712	45,722	805,800	799,840	5,960	23.0	23.1	13.0
Apparel and accessories.....	902,892	284,205	618,687	86,000	5,300	81,660	9.6	1.9	13.2
Miscellaneous fabricated textile products.....	55,892	20,999	34,893	6,000	280	5,720	10.7	1.3	16.4
Federal Government (not elsewhere classified).....	337,174	224,785	112,389	34,180	23,080	11,100	10.1	10.3	9.9
Industry not reported.....	2,052,256	1,418,210	634,046	541,740	389,840	151,900	26.4	27.5	24.0

Of the public emergency workers, in 1940, 61.4 percent of the total, 62.4 percent of the males, and 57.2 percent of the females reported the 7 industries named in the above table as their usual industries.

**Construction.**—The construction industry, as organized in 1929, was hard hit by the depression,<sup>2</sup> and it experienced a marked decline between 1930 and 1940 in the number of persons to whom it furnished employment. Notwithstanding this fact, the figures for the industry presented in table 7 show a considerable increase from 1930 to 1940 in the total number of workers. This increase is explained by the fact that the census figures cover public emergency construction as well as construction by private contractors and builders. If from the 3,508,434 persons in the construction industry in 1940, shown by the census figures (table 7), be deducted the 805,800 emergency workers (CCC, WPA, NYA, etc.) who reported that construction was their usual industry, the remainder—2,702,634—is 10.8 percent smaller than the 3,029,458 persons the census figures (table 7) show in the industry in 1930. The census figures for 1940 include, also, 646,360 persons who reported that they were seeking work and that construction was their usual industry. Many of these, in fact, may formerly have been emergency workers.

**Fishery.**—The 1940 census labor force was restricted to include only persons at work, or with a job, or seeking work during the week of March 24–30. Fishing is a seasonal industry. An examination made of selected 1940 census enumerators' schedules indicated that many fishermen who were not actually fishing during the week of March 24–30, and who were not employed at other work, and were not seeking work, were not included in the labor force. The number of workers in the fishery industry may have been fully as large in 1940 as in 1930.

**Industries classified with difficulty.**—As in the case of occupational designations, and for similar reasons (see p. 24), enumerators' returns of industry designations were sometimes so incomplete or indefinite that it was difficult to decide to which of two or more industry classifications a particular designation should be assigned. A large proportion of the indefinite returns were allocated to the proper industries through the use of information from the Censuses of Business and Manufactures, the Bureau of Mines, State industry directories, industrial, financial, utility, and railroad manuals, and other sources.

It is believed that the use of these collateral sources of information resulted in an accurate assignment in the majority of cases. While the number of returns that could not be allocated by such methods did not constitute a large proportion of the total, in the case of certain industries the number of faulty returns and the degree of inaccuracy in allocating them may have

affected perceptibly the accuracy of the statistics. The more important of these industries are referred to in the following paragraphs.

**Bakery products.**—It frequently was difficult to determine whether the return "Bakery" represented a factory that produces bakery products—to be assigned to "Bakery products," in manufacturing—or represented a small bakery that sells its own products at retail—to be assigned to "Food stores, except dairy products," in retail trade.

**Railway express service.**—It was difficult to classify the return "Express company," and it is believed that the coding clerks were not very successful in their attempt to distinguish railway express service from (a) trucking service, (b) "American Express Company"—a money order company—and (c) "Fruit Growers Express Company" and "Pacific Fruit Express Company"—companies engaged in renting railroad cars.

**Wholesale trade and retail trade.**—The Sixteenth Census enumerators were specifically instructed that in their returns they should "distinguish between *wholesale* and *retail* trade," and that if the establishment was engaged in both retail and wholesale trade they should specify the more important branch of the firm's activity, retail or wholesale trade. They were further instructed that if they could not ascertain the more important branch of the firm's activities they should abbreviate "wholesale-retail," as in "W-R plumbing supplies." But, either because the enumerators could not learn the facts, or for other reasons, they failed, quite commonly, to distinguish between wholesale trade and retail trade. Hence, the attempt of the coding clerks to distinguish, from the enumerators' returns, wholesale trade from retail trade was not very successful.

**Automobile storage and repair, motor vehicle retailing, and filling stations.**—Of all establishments, the garage probably is the most difficult to classify industrially, for a garage may be engaged in automobile storage, rental, and repair services only, or it may, and frequently does, combine with these services either the retailing of motor vehicles and accessories or the operation of a filling station, or both of these activities. It is quite evident that the overlapping of the three industries—

Automobile storage, rental, and repair services,  
Motor vehicles and accessories retailing, and  
Filling stations—

affected the accuracy of the enumerators' returns, the processing of these returns, and the resulting statistics.

**Firm names.**—Not infrequently, Sixteenth Census enumerators returned firm names instead of names of industries. In the majority of such cases, it was possible to determine the industries to which the firms should be assigned through recourse to industrial and other directories. But in the numerous cases in which,

<sup>2</sup> See 1941 Statistical Abstract, p. 957, and discussion of "Workers in the building trades," p. 29 of this report.

in the same locality, more than one firm with the same or a similar name was returned, and in the numerous cases in which the names returned were not found in the available directories, it was necessary to assign the returns to the group "Industry not reported."

*Industry not reported.*—In a large number of cases, the Sixteenth Census enumerators returned occupations without stating definitely in what industries they were pursued. A considerable proportion of such cases were assigned to the proper industries through recourse to industrial and city directories, but often it was impossible, even with the information obtainable from these sources, to classify the returns under any specified industries. In some such cases, it was possible to determine the group of related industries in which the occupations were pursued and to assign them to "Not specified textile mills," or "Not specified metal industries." In other cases, it was possible to determine

only the broad division of the industrial field in which the occupations were pursued and to assign them to "Not specified mining" or "Not specified manufacturing industries," or "Not specified transportation," or "Not specified retail trade." In many cases, however, nothing could be determined as to the industries in which the occupations were pursued. These returns were of necessity assigned to the class, "Industry not reported."

*Miscellaneous industries.*—The preceding paragraphs discuss the more important examples of incomplete and indefinite industry designations returned by the 1940 census enumerators. Other examples are given in the statement below. In the case of each industry return listed in the first column of the statement, it frequently was difficult to determine to which of the alternative classifications listed in the second column the return should be assigned.

MISCELLANEOUS INDUSTRIES INCOMPLETELY OR INDEFINITELY RETURNED: 1940

Column 1—Enumerators' returns	Column 2—Alternative census classifications	Column 1—Enumerators' returns	Column 2—Alternative census classifications
Car shop.....	Railroads (includes railroad repair shops). Manufacturing: Railroad and miscellaneous transportation equipment.	Pipe line.....	Petroleum and gasoline pipe lines. Gas works and steam plants. Construction.
Dairy.....	Agriculture. Manufacturing: Dairy products. Retail trade: Dairy products stores and milk retailing. Wholesale trade.	Produce company.....	Wholesale trade. Retail trade: Food stores, except dairy products.
Foundry.....	Miscellaneous iron and steel industries: [Iron foundry]. Miscellaneous nonferrous metal products: [Brass foundry, aluminum foundry, etc.].	Public utility.....	Electric light and power. Gas works and steam plants. Water and sanitary services.
Gas company.....	Crude petroleum and natural gas production. Gas works and steam plants. Miscellaneous chemical industries.	Railroad.....	Railroads (includes railroad repair shops). Street railways and bus lines.
Hat factory.....	Hats, except cloth and millinery. Apparel and accessories: [Millinery, trimmed hats, etc.].	Steel plant.....	Blast furnaces, steel works, and rolling mills. Miscellaneous iron and steel industries.
Lumber company.....	Sawmills and planing mills. Wholesale trade. Lumber and building material retailing.	Stockyards.....	Manufacturing: Meat products. Services incidental to transportation: [Stockyards].
Mine.....	Coal mining. Metal mining. Miscellaneous nonmetallic mining.	Tailor shop.....	Retail trade: Apparel and accessories stores, except shoes [Custom tailor shop]. Laundering, cleaning, and dyeing services.
Oil company.....	Crude petroleum and natural gas production. Petroleum and gasoline pipe lines. Petroleum refining. Filling stations. Wholesale trade.	Textile mill.....	Cotton manufactures. Silk and rayon manufactures. Woolen and worsted manufactures. Knit goods. Dyeing and finishing mills. Carpets, rugs, and other floor coverings. Miscellaneous textile goods. Apparel and accessories. Miscellaneous fabricated textile products.
Packing house.....	Manufacturing: Meat products. Wholesale trade: [Fruit packing house].		

TABLE 1.—OCCUPATIONS OF THE 1940 CENSUS CLASSIFICATION WITH THE CORRESPONDING OCCUPATIONS OF THE 1930 CENSUS CLASSIFICATION AND AN ADJUSTMENT FACTOR, FOR THE UNITED STATES

[The adjustment factor serves as an index of comparability between the 1940 and the 1930 figures. A factor above 1.00 indicates that the 1930 figure is too small for comparison with 1940, and a factor below 1.00 indicates that the 1930 figure is too large for comparison with 1940. The adjustments indicated take account of differences in classification, but not of differences between "labor force" of 1940 and "gainful workers" of 1930.]

Group*	OCCUPATION, 1940 CLASSIFICATION	OCCUPATION, 1930 CLASSIFICATION	ADJUSTMENT FACTOR (OR INDEX OF COMPARABILITY) <sup>1</sup>
<b>Professional and semiprofessional workers</b>			
1 23 103n	Actors, dancers, showmen, athletes, etc. Actors and actresses Dancers, showmen, and athletes Motion picture projectionists	Actors and showmen Teachers (athletics, dancing, etc.)	1.01
2	Architects	Architects	1.05
3	Artists and art teachers	Artists, sculptors, and teachers of art	1.00
4	Authors, editors, and reporters	Authors, editors, and reporters	1.151+
a	Authors	Authors	0.99
b	Editors and reporters	Editors and reporters	1.19
5	Chemists, assayers, and metallurgists	Chemists, assayers, and metallurgists	1.02
6	Clergymen	Clergymen	0.98
7	College presidents, professors, and instructors	College presidents and professors	1.01
8	Dentists	Dentists	0.99
9 25	Civil engineers and surveyors Civil engineers Surveyors	Civil engineers and surveyors	1.00
10	Electrical engineers	Electrical engineers	0.99
11	Mechanical and industrial engineers	Mechanical engineers	1.06
12b	Mechanical engineers Industrial engineers		
a	Chemical, mining, and metallurgical engineers	Mining engineers	1.00

<b>Farmers and farm managers</b>			
27a	Farmers (owners and tenants)	Farmers (owners and tenants)	1.00
b	Farm managers	(Combined with group 141a)	

## GENERAL NOTES:

\*The group designation preceding an occupation indicates the order of the occupation in the most detailed 1940 census classification, as published in the census reports. (Sixteenth Census, "The Labor Force (Sample Statistics)—Occupational Characteristics."—Appendix A). Occasionally, a line with no group designation has been inserted as a group title for two or more occupations of the classification.

<sup>1</sup> The degree of comparability between the 1930 and the 1940 published figures is shown by the deviation of the adjustment factor (entered in column 3) from 1.00. Hence, the degree of comparability is the same when the adjustment factor is 1.01 as when it is 0.99. When it is 1.01 the 1930 figures are 1 percent too small, and when it is 0.99 the 1930 figures are 1 percent too large. As a rule, in the case of each adjust-

ment factor, the decimal fraction is rounded to the nearest hundredths. For each occupation group having subgroups, however, the decimal fraction is rounded to the nearest thousandths and is followed by a plussign (+) to indicate that it is slightly too small or by a minus sign (−) to indicate that it is slightly too large.

<sup>2</sup> Wherever used in these lists, "n. e. c." means "not elsewhere classified" and "n. o. s." means "not otherwise specified."

<sup>3</sup> 1930 and 1940 groups not comparable.

## COMPARATIVE OCCUPATION STATISTICS, 1870-1940

TABLE 1.—OCCUPATIONS OF THE 1940 CENSUS CLASSIFICATION WITH THE CORRESPONDING OCCUPATIONS OF THE 1930 CENSUS CLASSIFICATION AND AN ADJUSTMENT FACTOR, FOR THE UNITED STATES—Continued

Group	OCCUPATION, 1940 CLASSIFICATION	OCCUPATION, 1930 CLASSIFICATION	ADJUSTMENT FACTOR (OR INDEX OF COMPARABILITY)
	<b>Proprietors, managers, and officials, except farm</b>		
28	Conductors, railroad.....	Conductors, steam railroad.....	1.00
29	Postmasters, and miscellaneous government officials.....		1.03
a	Inspectors, United States.....	<sup>3</sup> Officials and inspectors (city and county) Officials and inspectors (State and United States) Managers and officials, postal service <sup>4</sup> Inspectors, postal service <sup>5</sup>	
b	Inspectors, State.....		
c	Inspectors, city.....		
d	Inspectors, county and local.....		
e	Officials, United States.....

TABLE 2.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS), 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER, 1930, BY OCCUPATION AND SEX, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930 TOTAL FIGURES, FOR THE UNITED STATES

[The adjustment factor (which in each case was applied to the 1930 published number) serves also as an index of comparability between the 1940 and the 1930 figures. A factor above 1.00 indicates that the 1930 figure is too small for comparison with 1940, and a factor below 1.00 indicates that the 1930 figure is too large for comparison with 1940. The adjustments take account of differences in classification, but not of differences between "labor force" of 1940 and "gainful workers" of 1930. For a description of table 2, see p. 19; and for a discussion of comparisons presented for particular occupations, see pp. 22 to 30]

Group*	OCCUPATION, 1940 CLASSIFICATION	TOTAL				MALE		FEMALE	
		Labor force (except new workers), 1940	Gainful workers, 1930			Labor force (except new workers), 1940	Gainful workers as published, 1930	Labor force (except new workers), 1940	Gainful workers as published, 1930

\*The group designation preceding an occupation indicates the order of the occupation in the most detailed 1940 census classification, as published in the census reports. Occasionally, a line with no group designation has been inserted as a group title for two or more occupations of the classification.

†The degree of comparability between the 1930 and the 1940 published figures is shown by the deviation of the adjustment factor (entered in column 3) from 1.00. Hence, the degree of comparability is the same when the adjustment factor is 1.01 as when it is 0.99. When it is 1.01 the 1930 figures are 1 percent too small, and when it is 0.99 the 1930 figures are 1 percent too large. As a rule, in the case of each adjust-

ment factor, the decimal fraction is rounded to the nearest hundredths. For each occupation group having subgroups, however, the decimal fraction is rounded to the nearest thousandths and is followed by a plus sign (+) to indicate that it is slightly too small or by a minus sign (-) to indicate that it is slightly too large.

‡1930 and 1940 groups not comparable.

§1930 data not available.

¶Wherever used in this table, "n. e. c." means "not elsewhere classified."

‡For discussion of comparisons presented for specified occupations, see pp. 23-30.

<sup>a</sup> 1930 and 1940 groups not comparable.<sup>b</sup> 1930 data not available.<sup>c</sup> For discussion of comparisons presented for specified occupations, see pp. 23-30.<sup>d</sup> Mine laborers are included in "Mine operatives and laborers," in this group.<sup>e</sup> Drivers for bakeries, laundries, dry cleaners, stores, etc., are included in "Deliverymen."<sup>f</sup> As a rule, when the estimated index of comparability between the 1940 and the 1930 figures for an occupation was below 0.75 or above 1.25, the 1930 figures for the occupation were omitted from table 2 and reference was there made to the footnote, "1930 and 1940 groups not comparable." Exception to this rule was made in the few cases in which the numerical importance of the transfers made in revising the 1930

classification could be estimated with a high degree of probable accuracy. This is such a case.

<sup>g</sup> See discussion of "Operatives and laborers," p. 29.<sup>h</sup> Frequently, it was difficult to determine from the enumerators' returns whether a person was working in the "Silk and rayon manufactures" industry or in the "Rayon and allied products" industry.<sup>i</sup> The attempt of the occupation coders, in 1930, and again in 1940, to distinguish, from the enumerators' returns, the workers in hat factories (except cloth and millinery) from the workers in apparel and accessories factories was not very successful, and it is believed that the actual degree of comparability for workers in hat factories may be considerably lower than indicated by the adjustment factor.

TABLE 2.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS), 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER, 1930, BY OCCUPATION AND SEX, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930 TOTAL FIGURES, FOR THE UNITED STATES—Continued

<sup>1</sup> 1930 and 1940 groups not comparable.<sup>2</sup> 1930 data not available.<sup>3</sup> For discussion of comparisons presented for specified occupations, see pp. 23-30.<sup>4</sup> As a rule, when the estimated index of comparability between the 1940 and the 1930 figures for an occupation was below 0.75 or above 1.25, the 1930 figures for the occupation were omitted from table 2 and reference was made to the footnote, "1930 and 1940 groups not comparable." Exception to this rule was made in the few cases in which the numerical importance of the transfers made in revising the 1930 classification could be estimated with a high degree of probable accuracy. This is such a case.<sup>5</sup> See discussion of "Operatives and laborers," p. 29.<sup>6</sup> Frequently, it was difficult to determine from the enumerators' returns whether a person was working in the "Silk and rayon manufactures" industry or in the "Rayon and allied products" industry.<sup>7</sup> The attempt of the occupation coders, in 1930, and again in 1940, to distinguish, from the enumerators' returns, the workers in hat factories (except cloth and millinery) from the workers in apparel and accessories factories was not very successful, and it is believed that the actual degree of comparability for workers in hat factories may be considerably lower than indicated by the adjustment factor.<sup>8</sup> In 1930, many indefinite returns of the occupations and industries of workers in paper box factories probably were classified elsewhere.

TABLE 2.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS), 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER, 1930, BY OCCUPATION AND SEX, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930 TOTAL FIGURES, FOR THE UNITED STATES—Continued

<sup>1</sup> 1930 and 1940 groups not comparable.  
<sup>2</sup> 1930 data not available.

<sup>3</sup> See discussion of "Operatives and laborers," p. 29.

<sup>4</sup> Includes metal engraving (except for printing purposes), plating, and polishing.

TABLE 3.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS) IN 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER IN 1930, IN 1920, AND IN 1910, IN SELECTED OCCUPATIONS, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930, 1920, AND 1910 FIGURES, FOR THE UNITED STATES

[The adjustment factor (which in each case was applied to the 1930, the 1920, and the 1910 published number) serves also as an index of comparability between the 1930, 1920, and 1910 figures and the 1940 figures. A factor above 1.00 indicates that the 1930, 1920, and 1910 published figures are too small for comparison with 1940, and a factor below 1.00 indicates that the 1930, 1920, and 1910 published figures are too large for comparison with 1940. The adjustments take account of differences in classification, but not of differences between "labor force" of 1940 and "gainful workers" of 1930. For a description of table 3, see p. 20; and for a discussion of comparisons presented for particular occupations, see pp. 22 to 30.]

<sup>1</sup> The group designation preceding an occupation indicates the order of the occupation in the most detailed 1940 census classification, as published in the census reports. Occasionally, a line with no group designation has been inserted as a group title for two or more occupations of the classification.

<sup>2</sup> For explanation of degree of comparability and adjustment factor, see footnote 1, p. 35. In the case of each occupation in table 3, the adjustment factor applied to the 1930 published figures presented in table 2 was applied to the 1930, the 1920, and to the 1910 published figures presented in table 3, except that the adjusted figures for an occupation group having subgroups were obtained by adding the adjusted figures for the subgroups. No adjustment factor appears in column 5 in these cases. In the case of the combined group composed of group 37j and "Other retail trade and wholesale trade," and in the case of the group "Operatives and kindred workers (n. e. c.), silk and rayon industries," the number entered in column 5 is not an adjustment factor, but, rather, an index of comparability. For a discussion of the reliability of this method of adjusting the 1920 and 1910 figures, see p. 21.

<sup>3</sup> Aviators, designated "Aeronauts," were included with "Showmen" in 1910.

<sup>4</sup> Because of the difficulty of evaluating the effect of the classification changes, these adjusted figures may not be as reliable as those for 1930.

<sup>5</sup> Probably includes some teachers in schools below collegiate rank.

<sup>6</sup> For discussion of comparisons presented for specified occupations, see pp. 23-30.

<sup>7</sup> Figures for 1910 estimated.

<sup>8</sup> Whenever used in this table "n. e. c." means "not elsewhere classified."

<sup>9</sup> Proprietors in the two groups, "Corn shellers, hay balers, grain threshers, etc." and "Other and not specified pursuits," in 1920 and in 1910, are omitted from this group. On the other hand, the group includes, in 1920 and in 1910, managers, foremen, and laborers engaged in landscape gardening and managers of poultry farms. The effect of the difference in grouping on the comparability of the figures here presented is negligible.

<sup>10</sup> These figures include the estimated number of engineers in 1920—21,705.

<sup>11</sup> The 1920 and the 1910 figures do not include "Radio announcers, directors, managers, and officials," included in the 1930 figures.

TABLE 3.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS) IN 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER IN 1930, IN 1920, AND IN 1910, IN SELECTED OCCUPATIONS, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930, 1920, AND 1910 FIGURES, FOR THE UNITED STATES—Continued

<sup>1</sup> For explanation of degree of comparability and adjustment factor, see footnote 1, p. 35. In the case of each occupation in table 3, the adjustment factor applied to the 1930 published figures presented in table 2 was applied to the 1930, to the 1920, and to the 1910 published figures presented in table 3, except that the adjusted figures for an occupation group having subgroups were obtained by adding the adjusted figures for the subgroups. No adjustment factor appears in column 5 in these cases. In the case of the combined group composed of group 37 and "Other retail trade and wholesale trade," and in the case of the group "Operatives and kindred workers (n. e. c.), silk and rayon industries," the number entered in column 5 is not an adjustment factor, but, rather, an index of comparability. For a discussion of the reliability of this method of adjusting the 1920 and 1910 figures, see p. 21.

<sup>4</sup> Because of the difficulty of evaluating the effect of the classification changes, these adjusted figures may not be as reliable as are those for 1930.

<sup>5</sup> For discussion of comparisons presented for specified occupations, see pp. 23-30.

<sup>7</sup> Figures for 1910 estimated.

<sup>12</sup> Because of indefinite returns by census enumerators, it is probable that at each census some stationary engineers were included with locomotive engineers, and that some firemen of stationary boilers were included with locomotive firemen.

<sup>13</sup> Cement finishers were included in "Brick and stone masons," in 1910.

<sup>14</sup> At each census, it frequently was difficult, from the enumerators' returns, to distinguish tailors working at their trade from proprietors of clothing factories on the one hand and from operatives in clothing factories on the other.

<sup>15</sup> Neither in 1910, in 1920, nor in 1930 was the attempt to distinguish chauffeurs, motor truck drivers, and deliverymen from draymen, teamsters, and carriage drivers very successful.

Continued

<sup>1</sup> For explanation of degree of comparability and adjustment factor, see footnote 1, p. 35. In the case of each occupation in table 3, the adjustment factor applied to the 1930 published figures presented in table 2 was applied to the 1980, to the 1920, and to the 1910 published figures presented in table 3, except that the adjusted figures for an occupation group having subgroups were obtained by adding the adjusted figures for the subgroups. No adjustment factor appears in column 5 in these cases. In the case of the combined group composed of group 37) and "Other retail trade and wholesale trade," and in the case of the group "Operatives and kindred workers (n. e. c.), silk and rayon industries," the number entered in column 5 is not an adjustment factor, but, rather, an index of comparability. For a discussion of the reliability of this method of adjusting the 1920 and 1910 figures, see p. 21.

<sup>2</sup> Because of the difficulty of evaluating the effect of the classification changes, these adjusted figures may not be as reliable as are those for 1930.

<sup>3</sup> For discussion of comparisons presented for specified occupations, see pp. 23-30.

<sup>4</sup> The figures for operatives and laborers combined may be more nearly accurate than are the figures for either operatives or laborers.

<sup>5</sup> The few operatives in rayon factories in 1920 were classified with operatives in "Not specified textile mills." None were returned in 1910.

<sup>6</sup> Includes operatives in white goods factories, classified in the group "Other and not specified textile mills," in 1930.

<sup>7</sup> The attempt of the occupation coders to distinguish, from the enumerators' returns, the workers in hat factories (except cloth and millinery) from the workers in apparel and accessories factories was not very successful, and it is believed that the actual degree of comparability for workers in hat factories may be considerably lower than indicated by the adjustment factor.

<sup>8</sup> These figures include the estimated number of coopers in the two industries in 1920-12,011.

<sup>9</sup> Because of indefinite returns of occupations and industries, many of the workers in paper box factories were classified elsewhere in 1930, in 1920, and in 1910.

<sup>10</sup> These figures include the estimated number of glass blowers in 1920-8,986.

<sup>11</sup> Includes metal engraving (except for printing purposes), plating, and polishing.

<sup>12</sup> Automobile repair shops were included in this group in 1920 and in 1910, but not in 1930 or in 1940.

<sup>13</sup> For 1940 and 1930 data for the subgroups, see table 2, p. 56. Comparable 1920 and 1910 data for these subgroups are not available.

<sup>14</sup> "Attendants, pool rooms, bowling alleys, golf clubs, etc.," classified with servants in 1920 and in 1910, were classified elsewhere in 1930 and in 1940.

TABLE 3.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS) IN 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER IN 1930, IN 1920, AND IN 1910, IN SELECTED OCCUPATIONS, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930, 1920, AND 1910 FIGURES, FOR THE UNITED STATES—Continued

<sup>a</sup> For explanation of degree of comparability and adjustment factor, see footnote 1, p. 35. In the case of each occupation in table 3, the adjustment factor applied to the 1930 published figures presented in table 2 was applied to the 1920, to the 1910, and to the 1910 published figures presented in table 3, except that the adjusted figures for an occupation group having subgroups were obtained by adding the adjusted figures for the subgroups. No adjustment factor appears in column 5 in these cases. In the case of the combined group composed of group 37j and "Other retail trade and wholesale trade," and in the case of the group "Operatives and kindred workers (n. e. c.), silk and rayon industries," the number entered in column 5 is not an adjustment factor, but, rather, an index of comparability. For a discussion of the reliability of this method of adjusting the 1920 and 1910 figures, see p. 21.

<sup>b</sup> Because of the difficulty of evaluating the effect of the classification changes, these adjusted figures may not be as reliable as are those for 1930.

<sup>c</sup> For discussion of comparisons presented for specified occupations, see pp. 23-30.

<sup>d</sup> The figures for operatives and laborers combined may be more nearly accurate than are the figures for either operatives or laborers.

<sup>e</sup> Because of indefinite returns of occupations and industries, many of the workers in paper box factories were classified elsewhere in 1930, in 1920, and in 1910.

<sup>f</sup> Automobile repair shops were included in this group in 1920 and in 1910, but not in 1930 or in 1940.

<sup>g</sup> Includes "Attendant, hospital," classified elsewhere in 1940 and 1930.

<sup>h</sup> Managers and foremen of irrigation ditches, those engaged in landscape gardening, those on poultry farms, those in the group "Corn shellers, hay balers, grain threshers, etc.," and those in the group "Other and not specified pursuits," in agriculture, in 1920 and in 1910, were included in the group "Farm laborers (wage workers)."

<sup>i</sup> In 1920 and in 1910, only farm laborers on general farms were distinguished as working on the "home farm" or "working out." Hence, as here compiled for 1920 and 1910, the number of "Farm laborers (wage workers)" probably is too large and the number of "Farm laborers (unpaid family workers)" probably is too small. See, also, footnote 28.

<sup>j</sup> The figures for this group include figures for subgroups shown in table 2 but not in this table.

## OCCUPATION AND INDUSTRY STATISTICS, 1930 AND 1940

63

TABLE 4.—GAINFUL WORKERS 14 YEARS OLD AND OVER, BY OCCUPATION AND SEX, FOR THE UNITED STATES: 1930, 1920, AND 1910

[For a description of table 4, see p. 21. The figures in table 4 are the unadjusted published figures]

OCCUPATION, 1930 CLASSIFICATION	1930			1920			1910		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

Quarry operatives.....	65, 271	65, 246	25	45, 119	45, 043	76	80, 662	80, 617	45
Oil and gas well operatives.....	105, 210	105, 200	10	85, 503	85, 262	241	25, 550	25, 536	14
Salt well and works operatives.....	4, 124	3, 717	407	5, 464	4, 987	477	4, 356	4, 023	333
Manufacturing and mechanical industries.....	14, 105, 891	12, 220, 852	1, 885, 039	12, 822, 146	10, 894, 546	1, 927, 600	10, 823, 154	8, 813, 117	1, 810, 037
Apprentices to building and hand trades.....	39, 993	39, 935	28	73, 379	73, 323	56	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )
Blacksmiths' apprentices.....	680	680	-----	2, 624	2, 622	2	2, 698	2, 696	2
Boilermakers' apprentices.....	630	630	-----	1, 992	1, 992	-----	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )
Carpenters' apprentices.....	4, 094	4, 089	5	4, 668	4, 660	8	5, 891	5, 885	6
Electricians' apprentices.....	4, 600	4, 593	7	9, 502	9, 497	5	2, 647	2, 646	1
Machinists' apprentices.....	13, 560	13, 554	6	39, 287	39, 272	15	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )
Plumbers' apprentices.....	5, 926	5, 926	-----	7, 353	7, 353	-----	9, 859	9, 855	4
Tinsmiths' and coppersmiths' apprentices.....	1, 925	1, 925	-----	2, 800	2, 799	1	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )
Apprentices to other building and hand trades.....	8, 548	8, 538	10	5, 153	5, 123	25	6, 423	6, 408	15
Apprentices, except to building and hand trades.....	37, 188	33, 373	3, 815	65, 802	56, 654	9, 148	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )
Dressmakers' and milliners' apprentices.....	2, 136	20	2, 116	4, 155	15	4, 140	11, 727	31	11, 696
Jewelers', watchmakers', goldsmiths', and silversmiths' apprentices.....	1, 177	1, 041	136	2, 613	2, 230	383	1, 830	1, 762	68
Printers' and bookbinders' apprentices.....	10, 892	10, 540	352	11, 485	10, 268	1, 217	12, 081	11, 175	906
Other apprentices in manufacturing <sup>5</sup> .....	22, 983	21, 772	1, 211	47, 549	44, 141	3, 408	( <sup>4</sup> )	( <sup>4</sup> )	( <sup>4</sup> )
Bakers.....	140, 800	131, 884	8, 916	97, 940	93, 347	4, 593	89, 525	84, 748	4, 777
Blacksmiths, forgemen, and hammermen.....	147, 469	147, 460	9	221, 421	221, 416	5	240, 174	240, 143	31
Blacksmiths.....	124, 373	124, 365	8	195, 255	195, 251	4	232, 988	232, 957	31
Forgemen and hammermen.....	23, 096	23, 095	1	26, 166	26, 165	1	7, 186	7, 186	-----
Boilermakers.....	49, 923	49, 923	-----	74, 088	74, 088	-----	44, 761	44, 761	-----
Brick and stone masons and tile layers.....	170, 903	170, 896	7	131, 264	131, 257	7	169, 402	169, 387	15
Builders and building contractors.....	167, 512	167, 310	202	90, 109	90, 030	79	174, 422	173, 673	849
Cabinetmakers.....	57, 897	57, 890	7	45, 511	45, 503	8	41, 892	41, 884	8
Carpenters.....	929, 426	929, 376	50	887, 379	887, 208	171	817, 120	817, 082	38

<sup>1</sup> Because of changes made in 1930 in the classification of agricultural pursuits, it is impossible to group the 1920 and the 1910 occupations exactly according to the 1930 classification. It is believed, however, that the effect of the difference in grouping on the comparability of the figures here presented is negligible. In addition to the changes referred to, proprietors, foremen, and laborers on turpentine farms, classified in "Agriculture, forestry, etc.," in 1920 and in 1910, were transferred to "Manufacturing and mechanical industries" in 1930.

<sup>2</sup> Since, in 1920 and in 1910, only farm laborers on general farms were distinguished as working on the "home farm" or "working out," farm laborers on dairy farms, stock farms, truck farms, poultry farms, etc., who were, in fact, working on the "home farm" as "unpaid family workers" were not included in the group "Farm laborers (home farm)." Hence, as here compiled for 1920 and for 1910, the number of farm laborers classified as "Wage workers" probably is somewhat too large, and the number classified as "Unpaid family workers" probably is somewhat too small.

<sup>3</sup> Totals include occupation figures (for 1920: total, 281,741; male, 281,690; female, 51; for 1910: total, 97,222; male, 94,869; female, 2,353) omitted in detail because not comparable with 1930 figures.

<sup>4</sup> Comparable figures for 1910 not available.

<sup>5</sup> Figures for 1910 approximate only.

<sup>6</sup> Many of the machinists' apprentices probably are machine tenders.

<sup>7</sup> Includes, for 1920, the following groups, otherwise classified in 1930: "Apprentices, steam railroad"; "Apprentices, telegraph and telephone"; "Apprentices, other transportation and communication"; "Apprentices, wholesale and retail trade"; "Apprentices to other professional persons." (The group "Architects, designers, and draftsmen's apprentices," classified in "Manufacturing and mechanical industries" in 1920 and in 1910, was transferred to "Professional services" in 1930.)

<sup>8</sup> The 1910 figures include cement finishers; these numbered 7,621 in 1920.

## COMPARATIVE OCCUPATION STATISTICS, 1870-1940

TABLE 4.—GAINFUL WORKERS 14 YEARS OLD AND OVER, BY OCCUPATION AND SEX, FOR THE UNITED STATES: 1930, 1920, AND 1910—Continued

OCCUPATION, 1930 CLASSIFICATION	1930			1920			1910

<sup>12</sup> Not otherwise specified.<sup>13</sup> Comparable figures for 1920 and 1910 not available.<sup>14</sup> In 1920 and in 1910 automobile repair shops were included in the group "Other iron and steel factories."<sup>15</sup> Includes tin-plate mills.<sup>16</sup> Includes iron foundries.<sup>17</sup> Includes the few operatives reported in rayon factories in 1920. None were returned in 1910. See, also, footnote 22.<sup>18</sup> Operatives in bedding and quilt factories, hat and cap materials factories, and millinery factories, all included in the group "Other miscellaneous industries" in 1920 and in 1910, and operatives in white goods factories, included in the group "Other clothing factories" in 1920 and in 1910, were classified in the group "Other and not specified textile mills" in 1930. "Helpers, in motion-picture production," included in the group "Semiskilled operatives, other miscellaneous industries" in "Manufacturing and mechanical industries" in 1920 and in 1910, were transferred to "Professional service" in 1930.<sup>19</sup> The few laborers in rayon factories in 1920 were classified with laborers in "Not specified textile mills." None were reported in 1910.

## OCCUPATION AND INDUSTRY STATISTICS, 1930 AND 1940

67

TABLE 4.—GAINFUL WORKERS 14 YEARS OLD AND OVER, BY OCCUPATION AND SEX, FOR THE UNITED STATES: 1930, 1920, AND 1910—Continued

<sup>20</sup> Includes box factories (wood).<sup>21</sup> Laborers in leather bag factories, included in the group "Leather belt, leather case, etc., factories" in 1920 and in 1910, were transferred to the group "Trunk, suitcase, and bag factories" in 1930.<sup>22</sup> Includes the few laborers reported in rayon factories in 1920. See, also, footnote 26.<sup>23</sup> Laborers in bedding and quilt factories, hat and cap materials factories, and millinery factories, all included in the group "Other miscellaneous industries" in 1920 and in 1910, and laborers in white goods factories, included in the group "Other clothing factories" in 1920 and in 1910, were classified in the group "Other and not specified textile mills" in 1930.<sup>24</sup> "Farm laborers (turpentine farm)" were classified in "Agriculture" in 1920 and in 1910. See, also, footnote 26.<sup>25</sup> Not classified separately in 1920 or in 1910.<sup>26</sup> Neither in 1910, in 1920, nor in 1930 was the attempt to distinguish chauffeurs and motor truck drivers from draymen, teamsters, and carriage drivers very successful.<sup>27</sup> Teamsters in agriculture, forestry, and the extraction of minerals are classified with the other workers in those industries, respectively; drivers for bakeries and stores are classified as deliverymen in trade; and drivers for laundries are classified as deliverymen in domestic and personal service. See, also, footnote 31.<sup>28</sup> "Laborers, truck, transfer, and cab companies" were included with "Draymen, teamsters, and expressmen" in 1920 and in 1910.

## COMPARATIVE OCCUPATION STATISTICS, 1870-1940

<sup>1</sup> Figures for 1910 estimated.  
<sup>2</sup> Aviators, designated "Aeronauts" and included with "Showmen" in 1910 and classified as a separate group under "Other professional pursuits" in 1920, were transferred to "Transportation and communication" in 1930.  
<sup>3</sup> Included in the group "Other occupations" in 1920 and in 1910.  
<sup>4</sup> In 1920 and in 1910 this group included "Postmasters" classified in "Transportation and communication" in 1930.  
<sup>5</sup> Includes only those resident in continental United States at date of enumeration.  
<sup>6</sup> Probably includes some teachers in schools below collegiate rank.  
<sup>7</sup> Osteopaths were included with "Physicians and surgeons" in 1910.  
<sup>8</sup> Includes, also, all technical engineers not elsewhere classified.  
<sup>9</sup> Includes, also, chemical and metallurgical engineers.  
<sup>10</sup> In 1920 and in 1910 "County agents, farm demonstrators, etc." were included in the group "Agents," in "Clerical occupations," and "Social and welfare workers" were included in the group "Religious, charity, and welfare workers," in "Semiprofessional pursuits."

Shoemakers and cobblers (not in factory).....	22	22		69	69		18	18	
Upholsterers.....							4	4	

<sup>1</sup> Because of changes made in 1930 in the classification of agricultural pursuits, it is impossible to group the 1920 and the 1910 occupations exactly according to the 1930 classification. It is believed, however, that the effect of the difference in grouping on the comparability of the figures here presented is negligible. In addition to the changes referred to, proprietors, foremen, and laborers on turpentine farms, classified in "Agriculture, forestry, etc." in 1920 and in 1910, were transferred to "Manufacturing and mechanical industries" in 1930.

<sup>2</sup> Since, in 1920 and in 1910, only farm laborers on general farms were distinguished as working on the "home farm" or "working out," farm laborers on dairy farms, stock farms, truck farms, poultry farms, etc., who were, in fact, working on the "home farm" as "unpaid family workers" were not included in the group "Farm laborers (home farm)." Hence, as here compiled for 1920 and for 1910, the number of farm laborers classified as "Wage workers" probably is somewhat too large, and the number classified as "Unpaid family workers" probably is somewhat too small.

<sup>3</sup> Totals include occupation figures (total, 1,100; male, 881; female, 219) omitted in detail because not comparable with 1930 figures.

<sup>4</sup> Comparable figures for 1910 not available.

<sup>5</sup> Figures for 1910 approximate only.

<sup>6</sup> Many of the machinists' apprentices probably are machine tenders.

<sup>7</sup> Includes, for 1920, the following groups, otherwise classified in 1930: "Apprentices, steam railroad"; "Apprentices, telegraph and telephone"; "Apprentices, other transportation and communication"; "Apprentices, wholesale and retail trade"; "Apprentices to other professional persons." (The group "Architects, designers, and draftsmen's apprentices," classified in "Manufacturing and mechanical industries" in 1920 and in 1910, was transferred to "Professional service" in 1930.)

<sup>14</sup> Comparable figures for 1910 not available.<sup>15</sup> Comparable figures for 1920 and 1910 not available.<sup>16</sup> Not classified separately in 1920 or in 1910.<sup>17</sup> "Canvassers," classified in "Clerical occupations" in 1920 and in 1910, were transferred to "Trade" in 1930.<sup>18</sup> Included, in 1920 and in 1910, in the group "Bell boys, chore boys, etc.," in "Domestic and personal service."<sup>19</sup> "Laborers, professional service"; "Laborers, recreation and amusement"; and "Laborers, domestic and personal service" comprised the 1920 and 1910 group "Laborers, domestic and professional service."<sup>20</sup> "Deliverymen, laundries" were included in 1920 and in 1910 in the group "Deliverymen, bakeries and laundries," in "Trade."<sup>21</sup> "Attendants, pool rooms, bowling alleys, golf clubs, etc.," classified in "Professional service" in 1930, formed a part of the 1920 and 1910 group "Bell boys, chore boys, etc.," which was a subgroup of the group "Servants."<sup>22</sup> "Office appliance operators" were included in the group "Other clerks" in 1920 and in 1910.<sup>23</sup> Except telegraph messengers.

TABLE 6.—INDUSTRIES OF THE 1940 CENSUS CLASSIFICATION WITH THE CORRESPONDING INDUSTRIES OF THE 1930 CENSUS CLASSIFICATION AND AN ADJUSTMENT FACTOR, FOR THE UNITED STATES

The adjustment factor serves as an index of comparability between the 1940 and the 1930 figures. A factor above 1.00 indicates that the 1930 figure is too small for comparison with 1940, and a factor below 1.00 indicates that the 1930 figure is too large for comparison with 1940. The adjustments indicated take account of differences in classification, but not of differences between "labor force" of 1940 and "gainful workers" of 1930. See discussion, pp. 32 and 33. For a description of table 6, see p. 31.]

INDUSTRY, 1940 CLASSIFICATION	INDUSTRY, 1930 CLASSIFICATION	ADJUSTMENT FACTOR (OR INDEX OF COMPARABILITY) <sup>1</sup>	INDUSTRY, 1940 CLASSIFICATION	INDUSTRY, 1930 CLASSIFICATION	ADJUSTMENT FACTOR (OR INDEX OF COMPARABILITY) <sup>1</sup>
<b>Agriculture, forestry, and fishery.</b>			<b>Manufacturing—Continued.</b>		
Agriculture.....	Agriculture.....	0.991—	Lumber, furniture, and lumber products.....		1.017+
Forestry, except logging <sup>2</sup> .....	Turpentine farms and distilleries.....	0.99	Furniture and store fixtures.....	Furniture factories.....	1.01
Fishery.....	Fishing.....	1.15	Logging, sawmills, and miscellaneous wooden goods.....		1.02
<b>Mining.....</b>		<b>1.014</b>	Logging.....	Forestry	
Coal mining.....	Coal mines.....	1.00	Sawmills and planing mills.....	Saw and planing mills	
Crude petroleum and natural gas production.....	Oil wells and gas wells.....	1.02	Miscellaneous wooden goods.....	Other woodworking factories.....	
Metal mining.....		1.05	Paper and allied products.....		1.011+
	Copper mines.....		Pulp, paper, and paperboard mills.....	Paper and pulp mills.....	1.00
	Gold and silver mines.....		Paperboard containers and boxes.....	Paper box factories.....	1.03
	Iron mines.....		Miscellaneous paper and pulp products.....	Blank book, envelope, tag, paper bag, etc., factories.....	1.05
Sand and gravel production and stone quarrying.....	Quarries.....	0.98	Printing, publishing, and allied industries.....	Printing, publishing, and engraving.....	1.17
Sand and gravel production.....			Chemicals and allied products.....	(1930 and 1940 industries not comparable)	
Stone quarrying.....			Rayon and allied products.....	(Combined with "Silk and rayon manufactures")	
Miscellaneous nonmetallic mining.....	Other specified mines <sup>4</sup>		Paints, varnishes, and colors.....	Paint and varnish factories.....	1.06
Not specified mining.....	Not specified mines <sup>4</sup>		Miscellaneous chemical industries.....		1.06
<b>Construction.....</b>		1.00		Explosives, ammunition, and fireworks factories.....	
	Building industry.....			Fertilizer factories.....	
	Construction and maintenance of roads, streets, sewers, and bridges.....			Soap factories.....

Food and kindred products.....	Food and allied industries.....	0.980—		Salt wells and works.....	
Bakery products.....	Bakeries.....	0.79	Petroleum and coal products.....	(1930 data not available)	
Beverage industries.....	Liquor and beverage industries.....	1.03	Petroleum refining.....	Petroleum refineries.....	1.04
Meat products.....	Slaughter and packing houses.....	1.01	Miscellaneous petroleum and coal products.....	(1930 data not available)	
Canning and preserving fruits, vegetables, and sea food.....		1.07	Rubber products.....	Rubber factories.....	0.97
	Fish curing and packing, fruit and vegetable canning, etc.....		Leather and leather products.....		1.002—
Confectionery.....	Candy factories.....	1.16	Footwear industries, except rubber.....	Shoe factories.....	1.00
Dairy products.....	Butter, cheese, and condensed milk factories.....	1.16	Leather: tanned, curried, and finished.....	Tanneries.....	1.01
Grain-mill products and miscellaneous food industries.....		1.04	Leather products, except footwear.....		1.00
Grain-mill products.....	Flour and grain mills.....			Glove factories (50% of)	
Miscellaneous food industries.....	Sugar factories and refineries.....			Harness and saddle factories.....	
	Other food factories.....			Leather belt, leather goods, etc., factories.....	
Tobacco manufactures.....	Cigar and tobacco factories.....	1.00		Trunk, suitcase, and bag factories.....	
Textiles, textile and rayon products, and apparel.....		0.978—	Stone, clay, and glass products.....	(1930 data not available)	
Cotton manufactures.....	Cotton mills.....	1.01	Glass and glass products.....	Glass factories.....	1.08
Silk and rayon industries.....	Silk mills.....	0.888+	Structural clay products.....	Brick, tile, and terra-cotta factories.....	1.00
Silk and rayon manufactures.....	Silk factories.....	0.99	Cement, and concrete, gypsum, and plaster products.....	Lime, cement, and artificial stone factories.....	0.97
Rayon and allied products.....	Rayon factories.....	0.93	Cut-stone and stone products.....	Marble and stone yards.....	0.98
Woolen and worsted manufactures.....	Woolen and worsted mills.....	0.97	Pottery and related products.....	Potteries.....	1.00
Knit goods.....	Knitting mills.....	1.00	Miscellaneous nonmetallic mineral products.....	(1930 data not available)	
Dyeing and finishing textiles.....	Textile dyeing, finishing, and printing mills.....	1.00	Iron and steel and their products.....	(Corresponding 1930 and 1940 industries not comparable. Included in "Other metal and metalworking industries," below)	
Carpets, rugs, and other floor coverings.....	Carpet mills.....	1.23	Blast furnaces, steel works, and rolling mills.....		
Miscellaneous textile goods.....	Hemp, jute, and linen mills.....	1.15	Tin cans and other tinware.....		
	Lace and embroidery mills.....		Miscellaneous iron and steel industries.....		
	Rope and cordage factories.....		Nonferrous metals and their products.....		1.150+
Apparel, accessories, and hats.....		0.999+	Nonferrous metal primary and miscellaneous products.....		1.25
Apparel and accessories.....	Corset factories.....	1.00	Nonferrous metal primary products.....	Brass mills.....	
	Glove factories (50% of).....		Miscellaneous nonferrous metal products.....	Copper factories.....	
	Shirt, collar, and cuff factories.....			Lead and zinc factories.....	
	Suit, coat, and overall factories.....			Other metal factories.....	
Hats, except cloth and millinery.....	Other clothing factories.....	0.98	Clocks, watches, jewelry, and silverware <sup>3</sup>		0.97
	Hat factories (felt).....			Clock and watch factories.....	
Misc. fabricated textile products, and not specified textile mills.....	Straw factories.....	0.60	Machinery.....	Gold and silver factories.....	
Miscellaneous fabricated textile products.....	Sail, awning, and tent factories.....		Electrical machinery and equipment.....	Jewelry factories.....	
Not specified textile mills.....	Other and not specified textile mills.....			(1930 data not available)	
				Electrical machinery and supply factories.....	0.94

<sup>1</sup>The degree of comparability between the 1930 and the 1940 published figures is shown by the deviation of the adjustment factor (entered in column 3) from 1.00. Hence the degree of comparability is the same when the adjustment factor is 1.01 as when it is 0.99. When it is 1.01 the 1930 figures are 1 percent too small, and when it is 0.99 the 1930 figures are 1 percent too large. As a rule, in the case of each adjustment factor, the decimal fraction is rounded to the nearest hundredths. For each industry group having subgroups, however, the decimal fraction is rounded to the nearest thousandths and is followed by a plus sign (+) to indicate that it is slightly too small or by a minus sign (—) to indicate that it is slightly too large.

<sup>2</sup>Turpentine farms and distilleries formed a large proportion of this group.

<sup>3</sup>This rating is based on the totals for all industries in the division, some of which are not rated separately.

<sup>4</sup>1930 and 1940 industries not comparable.

<sup>5</sup>Includes metal engraving (except for printing purposes), plating, and polishing.

TABLE 6.—INDUSTRIES OF THE 1940 CENSUS CLASSIFICATION WITH THE CORRESPONDING INDUSTRIES OF THE 1930 CENSUS CLASSIFICATION AND AN ADJUSTMENT FACTOR, FOR THE UNITED STATES—Con.

Wholesale trade.....	(Combined with "Retail trade," below)		Industry not reported.....	Not specified industries and services <sup>8</sup>	

<sup>1</sup> 1930 and 1940 industries not comparable.<sup>2</sup> In the 1930 census statistics, "Wholesale and retail trade, except automobile," is shown as a single group.<sup>7</sup> "N. e. c." means not elsewhere classified.<sup>8</sup> 1930 and 1940 industries not compared.

TABLE 7.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS), 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER, 1930, BY INDUSTRY AND SEX, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930 TOTAL FIGURES, FOR THE UNITED STATES

[The adjustment factor (which in each case was applied to the 1930 published number) serves also as an index of comparability between the 1940 and the 1930 figures. A factor above 1.00 indicates that the 1930 figure is too small for comparison with 1940, and a factor below 1.00 indicates that the 1930 figure is too large for comparison with 1940. The adjustments take account of differences in classification, but not of differences between "labor force" of 1940 and "gainful workers" of 1930. For a description of table 7, see p. 31; and for a discussion of comparisons presented for particular industries, see pp. 32-34.]

INDUSTRY, 1940 CLASSIFICATION	TOTAL				MALE		FEMALE	
	Labor force (except new workers), 1940	Gainful workers, 1930			Labor force (except new workers), 1940	Gainful workers as published, 1930	Labor force (except new workers), 1940	Gainful workers as published, 1930

<sup>1</sup> The degree of comparability between the 1930 and the 1940 published figures is shown by the deviation of the adjustment factor (entered in column 3) from 1.00. Hence, the degree of comparability is the same when the adjustment factor is 1.01 as when it is 0.99. When it is 1.01 the 1930 figures are 1 percent too small, and when it is 0.99 the 1930 figures are 1 percent too large. As a rule, in the case of each adjustment factor, the decimal fraction is rounded to the nearest hundredths. For each industry group having subgroups, however, the decimal fraction is rounded to the nearest thousandths and is followed by a plus sign (+) to indicate that it is slightly too small or by a minus sign (—) to indicate that it is slightly too large.

<sup>2</sup> Turpentine farms and distilleries formed a large proportion of this group.

<sup>3</sup> For discussion of comparisons presented for specified industries, see pp. 32-34.

<sup>4</sup> This total, which was used in computing the rating given in column 3 and the adjusted total given in column 4, includes 46,919 persons not shown in detail.

<sup>5</sup> 1930 data not available.

<sup>6</sup> 1930 and 1940 industries not comparable.

<sup>7</sup> This total, which was used in computing the rating given in column 3 and the adjusted total given in column 4, includes 885,433 persons not shown in detail.

<sup>8</sup> Because of a tabulating error discovered too late for correction, the figures for "Cotton manufactures" include about 2,200 employed white females (in South Carolina) who should have been tabulated as in "Silk and rayon manufactures."

<sup>9</sup> Frequently, it was difficult to determine from the enumerators' returns whether a person was working in the "Silk and rayon manufactures" industry or in the "Rayon and allied products" industry.

<sup>10</sup> The attempt of the occupation coders, in 1930, and again in 1940, to distinguish, from the enumerators' returns, the workers in hat factories (except cloth and millinery) from the workers in apparel and accessories factories was not very successful, and it is believed that the estimated degree of comparability for workers in hat factories may be considerably too high.

<sup>11</sup> As a rule, when the estimated index of comparability between the 1940 and the 1930 figures for an industry was below 0.75 or above 1.25, the 1930 figures for the industry were omitted from table 7 and reference was there made to the footnote, "1930 and 1940 industries not comparable." Exception to this rule was made in the few cases in which the numerical importance of the transfers made in revising the 1930 classification could be estimated with a high degree of probable accuracy. This is such a case.

<sup>12</sup> In 1930, many indefinite returns of the occupations and industries of workers in paper box factories probably were classified elsewhere.

TABLE 7.—PERSONS 14 YEARS OLD AND OVER IN THE LABOR FORCE (EXCEPT NEW WORKERS), 1940, AND GAINFUL WORKERS 14 YEARS OLD AND OVER, 1930, BY INDUSTRY AND SEX, WITH AN ADJUSTMENT FACTOR AND ADJUSTED 1930 TOTAL FIGURES, FOR THE UNITED STATES—Continued
